(2) With a view to preventing such interference as aforesaid the licensee shall comply with all directions which shall be given to the licensee by the Postmaster-General and with all rules prescribed by the Postmaster-General for observance by his licensees—

(a) With respect to all arrangements to be adopted for the purpose of securing syntonised apparatus or for enabling the

messages exchanged by means of the licensed apparatus to be distinguished from those emanating from any other wireless telegraph station;

(b) With respect to any alteration of messages which the Postmaster-General may think necessary; and

(c) Generally with respect to avoiding interference between one wireless telegraph station and another.

6. The licensee apparatus shall not without the consent in writing of the Postmaster-General be altered or modified in respect of any of the particulars mentioned in the Schedule hereto.

7. The licensee shall at all times indemnify the Postmaster-General against all actions, claims and demands which may be brought or made by any corporation company or person in respect of any injury arising from any act licensed or permitted by these presents.

8. The licensee shall so far as possible receive from ships and light stations all requests for assistance and all signals of distress and retransmit them with the least possible delay to the proper authorities by means of the licensed apparatus or any other means in the power of the licensee.

9. Subject to the provisions of this licence the licensee shall not divulge to any person (other than properly authorised officials of His Majesty's Government or a competent legal tribunal) or make any use whatever of any message coming to the knowledge of the licensee and not intended for receipt by means of the licensed apparatus.

10. The Postmaster-General and any agent authorised in that behalf in writing by him may at all reasonable times enter upon all or any of the stations or other premises in the possession or occupation of the licensee either solely or jointly with any other person or persons for the purpose of inspecting and may inspect any apparatus fixed or being in such places respectively for the purpose of sending and receiving messages by wireless telegraphy and all other telegraphic instruments and apparatus fixed or being in such places respectively, and the working and use of such apparatus and telegraphic instruments respectively.

11. (1) All apparatus used or intended to be used by the licensee shall be so erected fixed placed and used as not either directly or by reason of the working or user thereof to interfere with the efficient or convenient maintenance working or user of any telegraphic line of the Postmaster-General which may from time to time exist or which it is probable that the Postmaster-General may have occasion to erect place fix or use or to expose any such line to risk of damage or to risk of interference with the efficient or convenient working or user thereof.

(2) In case any telegraphic line of the Postmaster-General shall be damaged or the efficient working or user thereof shall be wholly or partially interrupted or otherwise interfered with and the Engineer-in-Chief for the time being of the Post Office shall certify in writing under his hand that such damage interruption or interference has been caused directly or indirectly by any apparatus used or intended to be used by the licensee or by anything done by or on behalf of the licensee in relation thereto the licensee shall on demand pay to the Postmaster-General all

costs that shall be reasonably incurred by him in repairing such damage and in removing or altering such telegraphic line so as to restore the same to efficient working order and in adding thereto or substituting therefor either temporarily or permanently any other telegraphic line if the said Engineer-in-Chief shall certify that such addition or substitution is reasonably required.

(3) For the purposes of this Article the expression "telegraphic line" has the same meaning as in the Telegraph Act 1878 and the expression "telegraphic line of the Postmaster-General" includes a telegraphic line belonging to or worked by the Postmaster-General or constructed or maintained by him for any Department of the Government or other body or person.

12. (1) The licensee shall pay to the Postmaster-General on the 1st day of December next for and in respect of the licence hereby granted a royalty of £ per annum in respect of each station.

(2) In the event of the renewal of this licence the said royalty shall be payable on the same day in each succeeding year.

13. Except with the consent in writing of the Postmaster-General the licensee shall not assign underlet or otherwise dispose of or admit any other person or body to participate in the benefit of the licences powers or authorities hereby granted or any of such licences powers or authorities.

14. If and whenever in the opinion of one of His Majesty's Principal Secretaries of State an emergency shall have arisen in which it is expedient for the public service that His Majesty's Government shall have control over the transmission of messages by the licensed apparatus it shall be lawful for the said Secretary of State by warrant under his hand to direct and cause the licensed apparatus or any part hereof to be taken possession of in the name and on behalf of His Majesty and to be used for His Majesty's service and in that event any person authorised by the said Secretary of State may enter upon the stations offices and works of the licensee or any of them and take possession thereof and use the same as aforesaid.

15. The Postmaster-General may at any time in his absolute discretion give notice in writing to determine these presents and the licence or permission hereby given at the end of one calendar month from the date of such notice and at the expiration of that period the licence or permission hereby granted shall cease and determine accordingly but without prejudice to any remedy of the Postmaster-General under any condition or provision herein contained.

16. In any of the following cases (that is to say) —

(a) In case any sum of money which ought to be paid by the licensee to the Postmaster-General under or by virtue of these presents shall be in arrear and unpaid for one calendar month after the time at which the same ought to be paid under or by virtue of the provisions herein contained; or

(b) In case of any breach non-observance or non-performance by or on the part of the licensee of any of the provisions (other than a provision for the payment of money) or conditions herein contained;

then and in any such case the Postmaster-General may by writing under his seal revoke and determine these presents and the

powers and authorities hereinbefore granted and each and every of them and thereupon these presents and the said licences powers and authorities and each and every of them shall absolutely cease determine and become void.

Provided always that no such revocation or determination as aforesaid shall prejudice or affect any right of action or remedy which shall have accrued or shall thereafter accrue to the Postmaster-General under any condition or provision herein contained.

17. Nothing in these presents contained shall prejudice or affect the right of the Postmaster-General from time to time to establish extend maintain and work any system or systems of telegraphic communication (whether of a like nature to that hereby licensed or otherwise) in such manner as he shall in his discretion think fit neither shall anything herein contained prejudice or affect the right of the Postmaster-General from time to time to enter into agreements for or to grant licences relative to the working and user of telegraphs (whether of a like nature or those hereby licensed or otherwise) or the transmission of messages in any part of the United Kingdom by means of wireless telegraphy or by any other means with or to any person or persons whomsoever upon such terms as he shall in his discretion think fit and (save as in this licence expressly provided) nothing herein contained shall be deemed to authorise the licensee to exercise any of the powers or authorities conferred on or acquired by the Postmaster-General by or under the Telegraph Acts or any of them.

18. Any notice request or consent (whether expressed to be in writing or not) to be given by the Postmaster-General under these presents may be under the hand of any one of the Secretaries or Assistant Secretaries for the time being of the Post Office, and may be served by sending the same in a registered letter addressed to the licensee at the usual or last known place of residence or business of the licensee, and any notice to be given by the licensee under these presents may be served by sending the same in a registered letter addressed to the Secretary of the Post Office at the General Post Office, London.

F In October, 1912, the Board of Trade, at the request of the Lords Commissioners of the Admiralty, issued a notice directing the attention of Masters and Owners of British Merchant Vessels to the necessity for arranging for periodical practices in Wireless Telegraphy communications between H.M. Ships of War and Ships of the British Mercantile Marine for

the purpose of ensuring efficient and reliable communication when required.

The co-operation is invited of all British shipowners and masters whose ships are fitted with wireless telegraphy, in order to give effect to the following proposals:—

(1) At 8.30 a.m. and 2.30 p.m. daily any single man of war (destroyers and small craft excluded) or one man-of-war in a fleet in company, detailed by the Senior Naval Officer present, will adjust her wireless telegraphy transmitting and receiving apparatus to the commercial 600 metre wavelength and make the call "CCCC," followed by her own commercial call sign, indicating that she is prepared to carry out an exercise with any British merchant ship within range.

On a British merchant ship receiving this call she will answer and say whether or not she is prepared to proceed with the exercise. Should more than one merchant ship answer, the man-of-war will indicate which is to exercise and which is to wait.

The exercise will then proceed, but no messages are to be exchanged which are not authorised by the respective captains and masters of the ships practising. No message received during such exercises is to be forwarded beyond the ship actually receiving the message and no payment for any message can be made. The exercises are to be considered as strictly on Service and not for any commercial advantage.

(2) In all such exercises the man-of-war is to be considered the controlling ship.

(3) The exercises will cease at 9.15 a.m. and 3.15 p.m. respectively, or before, at the discretion of the captains concerned.

(4) These exercises are only to be carried out between vessels neither of which is within 150 miles range of any commercial shore station using the 600 metre wavelength, and are to cease at once should one of H.M. ships so direct.

MERCHANT SHIPPING (CONVENTION) ACT, 1914.

G An Act to make amendments of the law relating to Merchant Shipping as are necessary or expedient to give effect to an International Convention for the Safety of Life at Sea, signed in London on January the twentieth, nineteen hundred and fourteen, and for purposes incidental thereto. (August 10th, 1914.)

PART III.

(Which deals with Wireless Telegraphy.)

15. (1) Subject to the provisions of this Act every British ship registered in the United

THE SCHEDULE.

Name of Station.	Normal Range of Signalling.		Character of Apparatus.		Power.		If Alternator is used, No. of Cycles per Second.
	By Night.	By Day.	Description of Receiving Apparatus.	Wave-lengths (in Metres).	Source and Maximum Output.	Maximum to be taken by Transmitting Instruments.	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)

Kingdom which carries 50 or more persons shall be provided with a wireless telegraphy installation, and shall maintain a wireless telegraphy service which shall be at least sufficient to comply with the rules made for the purpose under this Act, and shall be provided with certified operators and watchers at least in accordance with those rules. Provided that the obligations imposed by this section shall not come into operation until such date, not being less than six months after the making of those rules, as may be specified in the rules.

(2) In reckoning the number of persons carried on a ship for the purpose of this section, persons shall not be counted who are exceptionally and temporarily carried on a ship—

(a) As the result of *force majeure*; or
(b) as the result of the necessity of increasing the number of the crew to fill the places of members of the crew who are ill or disabled; or

(c) as the result of the obligation on the part of the master to carry shipwrecked persons, or persons in like circumstances; or,

(d) if so provided by rules of the Board of Trade, as cargo hands for a part of the voyage not being between one continent and another and not being, during the time the hands are carried, outside the limits of latitude thirty degrees north and thirty degrees south.

(3) If this section is not complied with in the case of any ship, the master or owner of the ship shall be liable in respect of each offence to a fine not exceeding five hundred pounds, and any such offence may be prosecuted summarily, but if the offence is prosecuted summarily the fine shall not exceed one hundred pounds.

16. (1) The Board of Trade, in consultation with the Postmaster-General, shall make such rules with respect to wireless telegraphy installations and service on British ships which are registered in the United Kingdom and with respect to the carrying on those ships of operators and watchers for the purposes of wireless telegraphy, as appear to them necessary or expedient to carry into effect the provisions of the Convention mentioned in Part V of the Third Schedule to this Act.

(2) The Board of Trade may by rules made under this section exempt from the obligations of this Act as to wireless telegraphy—

(a) Ships while on voyages the course of which does not take the ship more than a hundred and fifty sea miles from the nearest coast, if the Board are satisfied that the route and the conditions of the voyage are such as to render compliance with those obligations unreasonable or unnecessary; and,

(b) sailing ships on which owing to the peculiar or primitive nature of their build, it is impossible to provide a proper wireless telegraphy installation.

(3) The Board of Trade may by rules made under this section provide that any automatic calling apparatus which is certified by them to be efficient and to have been accepted by the parties to the Convention may be substituted, for the purposes of the provisions of this Act and any rules made thereunder relating to wireless telegraphy, for a certified operator or watcher.

17. The Board of Trade may postpone the operation of the provisions of this Act relating to wireless telegraphy as respects any particular

ship for such period as the Board of Trade determine in each case, if it is shown by the owners of the ship that they have taken all reasonable steps to comply with the provisions of this Act as respects the ships, but that they have been unable to do so owing to difficulties in obtaining delivery of any wireless telegraphy apparatus or of obtaining the service of certificated operators or watchers.

The period of postponement under this section shall not exceed one year in the case of ships which are required in pursuance of the Convention to provide a first-class wireless telegraphy service, and two years in the case of ships which are so required to provide a third-class wireless telegraphy service, and in the case of ships which are so required to provide a second-class wireless telegraphy service, shall not exceed one year as respects the provision of a wireless telegraphy installation and two years as respects the provision of a continuous watch.

EXTRACT FROM THE DEFENCE OF THE REALM (CONSOLIDATION) REGULATIONS, 1914.

22. No person shall, without the written permission of the Postmaster-General, make, buy, sell, or have in his possession, or under his control, any apparatus for the sending or receiving of messages by wireless telegraphy, or any apparatus intended to be used as a component part of such apparatus; and no person shall sell any such apparatus to any person who has not obtained such permission as aforesaid, and any person having in his possession or under his control any such apparatus, whether with or without the permission of the Postmaster-General, shall on demand deliver the apparatus to the Postmaster-General, or as he may direct; and if any person contravenes the provisions of this regulation he shall be guilty of an offence against these regulations.

If the competent naval or military authority has reason to suspect that any person having in his possession any apparatus for sending or receiving messages by telegraphy, wireless telegraphy, telephony, or other electrical or mechanical means is using, or about to use, the same for any purpose prejudicial to the public safety or the defence of the realm, he may, by order, prohibit that person from having any such apparatus in his possession, and may take such steps as are necessary for enforcing the Order, and if that person subsequently has in his possession any apparatus in contravention of the Order he shall be guilty of an offence against these regulations.

For the purposes of this regulation any apparatus ordinarily used as a distinctive component part of apparatus for the sending or receiving of messages by wireless telegraphy shall be deemed to be intended to be so used unless the contrary is proved.

I EXTRACTS FROM SUPPLEMENT TO THE LONDON GAZETTE OF TUESDAY, THE 29TH OF APRIL, 1919.

Wednesday, 30th April, 1919.

Air Ministry.

AIR NAVIGATION REGULATIONS, 1919.
ORDER OF THE SECRETARY OF STATE UNDER THE AIR NAVIGATION ACTS, 1911 TO 1919.

In pursuance of the powers conferred upon me by the Air Navigation Acts, 1911 to 1919,

and all other powers enabling me in that behalf, I, the Right Honourable Winston Spencer Churchill, one of His Majesty's Principal Secretaries of State, by order make the following regulations:—

GENERAL CONDITIONS OF FLYING.

1. No aircraft shall fly within the limits of the British Islands and the territorial waters adjacent thereto unless the following conditions are complied with:—

(6) No mails shall be carried without the consent in writing of the Postmaster-General and no wireless apparatus shall be installed or worked except under and in accordance with a licence granted by the Postmaster-General, containing such conditions as may be approved by the Secretary of State:

PRODUCTION OF LICENCES, CERTIFICATES AND LOG-BOOKS FOR INSPECTION.

6. (1) Any member of the personnel of an aircraft shall on demand produce his licence for the inspection of any person authorised for the purpose by the Secretary of State.

(2) The owner and person in charge of any aircraft shall, on demand, produce for the inspection of any person authorised for the purpose by the Secretary of State, any certificates or licences relating to the aircraft, and also, in the case of passenger or goods aircraft, any of the prescribed log-books.

EXCEPTIONS.

8. These regulations do not, except where otherwise expressly stated, apply—

(a) to military aircraft belonging to or employed in the service of His Majesty; or

(b) to any aircraft or to any persons if and to such extent as such aircraft or persons may be excepted from these regulations, or any of them, by direction of the Secretary of State on the recommendation of a Government Department.

PENALTIES.

10. (1) Where any aircraft flies in contravention of, or fails to comply with, these regulations or any provision thereof, the owner of the aircraft, and also the pilot or commander, shall be deemed to have contravened, or, as the case may be, failed to comply with these regulations:

Provided that it shall be a good defence to any proceedings for contravention or failure to comply with these regulations if the contravention or failure is proved to have been due to stress of weather or other unavoidable cause.

(2) If any person obstructs or impedes any person acting under the authority of the Secretary of State in the exercise of his powers and duties under these regulations, such first-mentioned person shall be deemed to have acted in contravention of these regulations.

(3) Any person contravening or failing to comply with these regulations or any provision thereof is liable to imprisonment for a term not exceeding six months or to a fine not exceeding two hundred pounds, or to both such imprisonment and fine.

(5) If any person in any aircraft is guilty of any act of espionage to which the provisions of section one of the Official Secrets Act, 1911, apply, he is liable to penal servitude for a term not exceeding seven years.

INTERPRETATION.

12. In these regulations, unless the context otherwise requires—

"Aircraft" includes airships and flying machines, all balloons, whether fixed or free, and kites;

"Military aircraft" includes naval, military, and air-force aircraft;

"Personnel" (in relation to any aircraft) includes any pilot, commander, navigator, and engineer, and any operative member of the crew;

The Interpretation Act, 1889, applies for the purpose of the interpretation of these regulations as it applies for the purpose of the interpretation of an Act of Parliament, and as if these regulations were an Act of Parliament.

SHORT TITLE.

14. These regulations may be cited as the Air Navigation Regulations, 1919.

WINSTON S. CHURCHILL,

One of His Majesty's Principal Secretaries of State.

Air Ministry, London,
30th April, 1919.

J CIRCULAR TO OWNERS AND MASTERS OF BRITISH MERCHANT SHIPS.

WIRELESS TELEGRAPHY IN MERCHANT SHIPS — RELAXATION OF RESTRICTIONS.

II. Restrictions on Use of Wireless Telegraphy.

1. All restrictions on the use of wireless telegraphy in ships are removed, except in the following waters:—

Baltic.

Black Sea and Sea of Marmora.

2. In the above waters wireless telegraphy communications are permitted as follows:—

(i) Between masters and owners on matters concerning the safety and working of the ship.

(ii) Between masters and naval authorities. Messages must be in code. A special code is supplied for this.

(iii) Official messages from accredited Ministers or Officials of H.M. Governments, or Officers of the Naval or Military Forces travelling in their official capacities as passengers on board, to Government departments, or Naval or Military authorities on shore. Should such officials require to send messages of any other description, they should be shown these instructions as constituting the Master's authority for refusing to have messages despatched.

(iv) Private telegrams are forbidden.

It should be borne in mind that stations belonging to foreign Governments are not yet all open to public correspondence.

3. In order to avoid delay in making distress signals whilst in the above waters the Master is responsible that the wireless telegraphy office is informed whenever the vessel enters any of these zones. Whilst in these zones the operator is to be kept supplied, while on watch, with the position of the vessel. This is to be communicated to the operator in writing, and is to be corrected every half-hour.

4. Outside the waters named in par. 1 private messages are admitted.

Note.—Owners wishing to divert their ships by wireless should now send the necessary

message direct, and not through the Director Mercantile Movements as heretofore.

This Circular cancels and replaces Section XXXII of "Admiralty Instructions for British Merchant Ships" (Addendum of 25th August, 1919, and Circular of 31st July, 1919).

Naval Staff,
Admiralty,
Nov. 22nd, 1919.

K MERCHANT SHIPPING (WIRELESS TELEGRAPHY) ACT, 1919. CHAPTER 38.

AN ACT TO MAKE FURTHER PROVISION WITH RESPECT TO WIRELESS TELEGRAPHY ON SHIPS.

August 15th, 1919.

Be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

1. (1) Every sea-going British ship registered in the United Kingdom being a passenger steamer or a ship of sixteen hundred tons gross tonnage or upwards shall be provided with a wireless telegraph installation, and shall maintain a wireless telegraph service which shall be at least sufficient to comply with the rules made for the purpose under this Act, and shall be provided with one or more certified operators and watchers, at least in accordance with those rules:

Provided that the Board of Trade may exempt from the obligations imposed by this Act any ships or classes of ships if they are of opinion that, having regard to the nature of the voyages on which the ships are engaged, or other circumstances of the case, the provision of a wireless telegraph apparatus is unnecessary or unreasonable.

(2) The Board of Trade, in consultation with the Postmaster-General, shall make rules prescribing the nature of the wireless telegraph installation to be provided, of the services to be maintained, and the number, grade, and qualifications of operators and watchers to be carried:

Provided that no ship shall be required to carry more than one operator unless more than one operator would have been required under the provisions of the Merchant Shipping (Convention) Act, 1914.

(3) If this section is not complied with in the case of any ship, the master or owner of the ship shall be liable in respect of each offence to a fine not exceeding five hundred pounds, and any such offence may be prosecuted summarily, but if the offence is prosecuted summarily, the fine shall not exceed one hundred pounds.

(4) A surveyor of ships or a wireless telegraphy inspector may inspect any ship for the purpose of seeing that she is properly provided with a wireless telegraph installation and certified operators and watchers in conformity with this Act, and for the purpose of that inspection shall have all the powers of a Board of Trade inspector under the Merchant Shipping Acts, 1894 to 1916.

If the said surveyor or inspector finds that the ship is not so provided, he shall give to the master or owner notice in writing pointing out the deficiency, and also pointing out what in his opinion is requisite to remedy the same.

Every notice so given shall be communicated in the manner directed by the Board of Trade to the chief officer of customs of any port at which the ship may seek to obtain a clearance or transire, and the ship shall be detained until a certificate under the hand of any such surveyor or inspector is produced to the effect that the ship is properly provided with wireless telegraph installation and certified operators and watchers in conformity with this Act.

(5) The obligations imposed by this Act shall not come into operation while the obligations with respect to wireless telegraphy on ships imposed by the Defence of the Realm Regulations remain in force, but shall be in addition to, and not in substitution for, the obligations as to wireless telegraphy imposed by the Wireless Telegraphy Act, 1904, or any Order in Council, or regulations made thereunder, or by the Merchant Shipping (Convention) Act, 1914.

2. The foregoing provisions of this Act shall, as from a date three months after the coming into operation of the obligations imposed by this Act on British ships registered in the United Kingdom, apply to ships other than British ships registered in the United Kingdom while they are within any port in the United Kingdom in like manner as they apply to British ships so registered.

3. (1) This Act may be cited as the Merchant Shipping (Wireless Telegraphy) Act, 1919, and the Merchant Shipping Acts, 1894 to 1916, and this Act may be cited together as the Merchant Shipping Acts, 1894 to 1919.

(2) This Act shall be construed as one with the Merchant Shipping Act, 1894, and "passenger steamer" shall mean a steamer which carries more than twelve passengers, and "wireless telegraphy inspector" means an officer appointed under section twenty of the Merchant Shipping (Convention) Act, 1914, for the purposes therein mentioned.

THE MERCHANT SHIPPING (WIRELESS TELEGRAPHY) RULES, 1920.
DATED JULY 10th, 1920.
L MADE BY THE BOARD OF TRADE UNDER THE MERCHANT SHIPPING (WIRELESS TELEGRAPHY) ACT, 1919 (9 & 10 GEO. 5, C. 38).

The Board of Trade hereby make the following rules under the provisions of the Merchant Shipping (Wireless Telegraphy) Act, 1919.

Dated this tenth day of July, 1920.

H. A. PAYNE,
Secretary to the Board of Trade.

INTERPRETATION.

1. In these Rules—

The expression "coasting trade" means trade exclusively carried on between ports in the British Islands.

The number of hours occupied in a voyage from port to port means the normal number of hours occupied in a voyage between one port of call and the next.

CLASSIFICATION OF SHIPS.

2. For the purposes of these Rules ships shall be classified as follows:—

Class I—Ships carrying 200 persons or more which are not engaged in the coasting trade.

Class II—Ships not engaged in the coasting trade carrying 50 but less than 200 persons and ships engaged in the coasting trade carrying 50 persons or more.

Class III—Ships carrying less than 50 persons. In reckoning the number of persons carried by a ship there shall be included the normal crew of the ship and the maximum number of passengers permitted to be carried by the passenger certificate of the ship.

NATURE OF INSTALLATION.

3. The installation shall comply with the requirements of the International Radiotelegraph Convention, 1912, as modified by any other international agreement (and in particular the International Convention of Safety of Life at Sea, 1914), or of any international agreement by which the said Convention of 1912 may be superseded.

4. The installation shall be of the spark or interrupted continuous wave type.

5. (1). The installation shall include a normal installation and an emergency installation, except that where the normal installation complies with the requirements of this rule as to emergency installations as well as those as to normal installations a normal installation alone shall suffice.

(2) A normal installation must be capable of transmitting clearly perceptible signals from ship to ship over a range of at least 100 nautical miles by day under normal condition and circumstances.

(3) An emergency installation must include an independent source of energy capable of being put into operation rapidly and of working for at least six continuous hours with a minimum range from ship to ship of 80 nautical miles for ships of Class I, and 50 nautical miles for ships of Classes II and III, and such independent source of energy must be capable of being worked for at least six continuous hours independently from the source of propelling power for the ship, the steam supply system and the main electricity supply system.

(4) For the purposes of this rule an installation shall be deemed to comply with the above requirements as to range if it is able to maintain communication on a 600 metre wave at a range of one-and-a-half times the number of nautical miles hereinbefore respectively prescribed over sea by day with a Post Office Standard Station when employing a receiver without amplification devices.

6. There shall be provided between the bridge and the wireless telegraph room means of communication by voice pipe, telephone or other means and an operator or watcher when on duty shall not leave the wireless telegraph room to deliver messages or to call his relief.

SHIPS NOT FITTED WITH APPROVED AUTOMATIC APPARATUS.

7. If not fitted with an approved automatic apparatus for registering the signal of distress—

(i) A ship of Class I shall carry certificated operators in accordance with the following table, and while at sea a certificated operator shall be always on watch:—

NATURE OF VOYAGE.	NUMBER AND GRADE OF OPERATORS.
(a) Voyage exceeding 48 hours from port to port.	Three operators, of whom one shall hold a First Grade Certificate, and not more than one a Third Grade Certificate.
(b) Voyage exceeding 8 hours but not exceeding 48 hours from port to port.	Two operators of whom one shall hold a First or a Second Grade certificate.
(c) Voyage not exceeding 8 hours from port to port.	One operator who shall hold a First or a Second Grade certificate.

(ii) A ship of Class II shall carry certificated operators and certificated watchers in accordance with the following table, and while at sea a certificated operator shall always be on watch at the times specified in the Schedule to these Rules, and either a certificated operator or a certificated watcher shall always be on watch at other times.

NATURE OF VOYAGE.	NUMBER AND GRADE OF OPERATORS AND WATCHERS.
(a) Voyage exceeding 48 hours from port to port.	One operator who shall hold a First or a Second Grade certificate, and two watchers.
(b) Voyage exceeding 8 hours but not exceeding 48 hours from port to port.	One operator who shall hold a First or a Second Grade certificate, and one watcher.
(c) Voyage not exceeding 8 hours from port to port.	One operator who shall hold a First or a Second Grade certificate.

(iii) A ship of Class III shall carry one operator who shall hold a First or a Second Grade certificate, and while at sea the operator shall always be on watch at the times specified in the Schedule to these Rules.

SHIPS FITTED WITH APPROVED AUTOMATIC APPARATUS.

8. In the event of an automatic apparatus for registering the signal of distress being approved by the Board of Trade and the Postmaster-General a ship of Class III shall be fitted with such apparatus unless the duration of the voyage on which it is employed does not exceed eight hours from port to port, but in such a case the operator shall be on watch during the whole time of the voyage.

9. If fitted with automatic apparatus for registering the signal of distress approved as aforesaid:—

(i) A ship of Class I shall carry certificated operators in accordance with the following table and while at sea a certificated operator shall always be on watch during the times specified in the Schedule to these Rules, and a watch shall be maintained at all other times either by a certificated operator, or by a watcher, or by means of the approved automatic apparatus:—

NATURE OF VOYAGE.	NUMBER AND GRADE OF OPERATORS.
(a) Voyage exceeding 48 hours from port to port.	Two operators, one of whom shall hold a First Grade certificate.
(b) Voyage not exceeding 48 hours from port to port.	One operator who shall hold a First or a Second Grade certificate.

(ii) A ship of Class II shall carry one operator who shall hold a First or a Second Grade certificate, and while at sea the operator shall be on watch during the times specified in the Schedule to these Rules, and a watch shall be maintained at all other times either by an operator, or by a watcher, or by means of the approved automatic apparatus.

(iii) A ship of Class III shall carry one operator who shall hold a First or a Second Grade certificate, and while at sea the operator shall be on watch during the times specified in the Schedule to these Rules, and a watch shall be maintained at all other times either by an operator, or by a watcher, or by means of the approved automatic apparatus.

Provided that if a ship of Class III is fitted with an automatic apparatus for registering the signal of distress and with an automatic

apparatus for registering the ship's own distinguishing signal, both of which have been approved by the Board of Trade and the Postmaster-General, the operator shall not, while the ship is more than 150 nautical miles from any coast station, be required to be on watch at the times specified in the Schedule to these Rules.

QUALIFICATIONS OF OPERATORS.

10. (1) Operators shall be graded into three grades in accordance with Rules to be made by the Postmaster-General with the concurrence of the Board of Trade and watchers shall be certificated by the Postmaster-General.

(2) Until graded in accordance with such Rules as aforesaid:—

(i) An operator who holds the Postmaster-General's First Class certificate of Proficiency and who has had three years' experience as an operator may be employed as if he held a First Grade certificate, but if an operator holding a First Grade certificate is available an operator holding a First Class certificate shall not be so employed on a ship of Class I which is required by these Rules to carry three operators.

(ii) An operator who holds the Postmaster-General's First or Second Class certificate of Proficiency and who has had one year's experience as an operator may be employed as if he held a Second Grade certificate.

(iii) An operator who holds the Postmaster-General's First or Second Class certificate of Proficiency and who has had less than one year's experience as an operator may be employed as if he held a Third Grade certificate.

11. The Postmaster-General may accept certificates granted to operators by the Govern-

ment of any part of His Majesty's Dominions or of a foreign country in pursuance of the regulations annexed to any International Radiotelegraph Convention for the time being in force.

12. These Rules shall come into operation on the 1st day of September, 1920.

Schedule.

TIMES OF WATCH FOR SHIPS REQUIRED TO CARRY ONE OR TWO OPERATORS.

Zones.	Western Limit.	Eastern Limit.	Times of Watch for One Operator, Greenwich Mean Time.	Times of Watch for Two Operators, Greenwich Mean Time.
A. Eastern Atlantic, Mediterranean, North Sea, Baltic, Western Arctic Sea.	Meridian of 30° W., Coast of Greenland.	Meridian of 30° E. to the South of the Coast of Africa. Eastern limit of Mediterranean, Black Sea, and of the Baltic, 30° E. to the North of Coast of Norway.	from 8 h. to 10 h. 12 h. „ 14 h. 16 h. „ 18 h. 20 h. „ 22 h.	from 0 h. to 6 h. 8 h. „ 14 h. 16 h. „ 18 h. 20 h. „ 22 h.
B. Indian Ocean, Eastern Arctic Sea.	Eastern Limit of Zone A	Meridian of 90° East	from 0 h. to 2 h. 12 h. „ 14 h. 16 h. „ 18 h. 20 h. „ 22 h.	from 0 h. to 2 h. 4 h. „ 10 h. 12 h. „ 14 h. 16 h. „ 18 h. 20 h. „ 24 h.
C. China Sea, Western Pacific Ocean.	Eastern Limit of Zone B.	Meridian of 160° E.	from 0 h. to 2 h. 4 h. „ 6 h. 12 h. „ 14 h. 20 h. „ 22 h.	from 0 h. to 6 h. 8 h. „ 10 h. 12 h. „ 14 h. 16 h. „ 22 h.
D. Central Pacific Ocean.	Eastern Limit of Zone C.	Meridian of 140° W	from 0 h. to 2 h. 4 h. „ 6 h. 8 h. „ 10 h. 20 h. „ 22 h.	from 0 h. to 2 h. 4 h. „ 6 h. 8 h. „ 10 h. 12 h. „ 18 h. 20 h. „ 24 h.
E. Eastern Pacific Ocean.	Eastern Limit of Zone D.	Meridian of 70° W. South of the Coast of America, West Coast of America.	from 0 h. to 2 h. 4 h. „ 6 h. 16 h. „ 18 h. 20 h. „ 22 h.	from 0 h. to 2 h. 4 h. „ 6 h. 6 h. „ 14 h. 16 h. „ 22 h.
F. Western Atlantic Ocean and Gulf of Mexico.	Meridian of 70° W. South of the Coast of America, East Coast of America.	Meridian of 30° W., Coast of Greenland.	from 0 h. to 2 h. 12 h. „ 14 h. 16 h. „ 18 h. 20 h. „ 22 h.	from 0 h. to 2 h. 4 h. „ 10 h. 12 h. „ 18 h. 20 h. „ 22 h.

EXPERIMENTS IN WIRELESS TELEGRAPHY.

AUTHORITY FOR SENDING AND RECEIVING.

SUMMARY OF CONDITIONS OF ISSUE.

N.B.—Under the Wireless Telegraphy Act, 1904, the Postmaster-General's authority is necessary before any apparatus for wireless telegraphy is installed or worked.

(Note.—All sending stations must also be equipped for reception.)

1. Applicants must produce evidence of British nationality and two written references from persons of British birth and of standing, not related to them.

2. Installation must be approved by Postmaster-General.

3. Secrecy of correspondence must be observed.

4. Applicants must satisfy the Postmaster-General that they have in view some definite object of scientific value or general public utility. If scientific research is intended they should be certified as competent investigators by a Government Department or some recognised scientific body.

5. Each sending station must be under the charge of a person who has satisfied the Postmaster-General, by examination or otherwise, that he has attained:—

(a) A sufficient knowledge of the adjustment and operation of the apparatus which he wishes to work.

(b) A knowledge of the regulations of the International Convention in so far as they relate to the prevention of inter-

ference and impose certain duties on all wireless operators; (these are contained in Section V of the "Postmaster-General's Hand-book for Wireless Operators," which is sold by the Stationery Office).

- (c) An operating speed of at least 12 words (Morse) a minute, sending and receiving.

A fee of 5s. will be charged for the examination referred to above, when necessary.

A licensee not possessing the above qualifications may be allowed, exceptionally, to employ a qualified operator to work the sending apparatus.

6. It is proposed to charge small fees to cover clerical expenses and expenses of inspection, etc. For each station authorised to use power up to 10 watts the charges, which will cover the use of receiving as well as sending apparatus, will comprise an initial licensing fee of 10s., plus an annual fee of £1, payable in advance (*i.e.*, 30s. for the first year and £1 for each succeeding year). Higher fees will be charged for more powerful stations.

7. Transmission will be sanctioned only to specified and duly authorised stations, not exceeding five in number. The written consent of the owner of each station to receive signals from the applicant's transmitting station should be furnished.

8. AERIALS.

The maximum height and dimensions allowed are as follows:—

Extreme height of aerial above ground	100 feet.
Total length of wire, including leading-in wires	100 feet for single-wire aerial; 140 feet of wire where two or more wires are used (<i>e.g.</i> , total length of 70 feet of double wire).

9. PORTABLE STATIONS.

General conditions same as for fixed stations. Power of portable sending stations will usually be limited to 10 watts.

Use will ordinarily be authorised only within 10 miles of a fixed point.

EXPERIMENTS IN WIRELESS TELEGRAPHY.

N AUTHORITY FOR THE USE OF RECEIVING APPARATUS.

CONDITIONS OF ISSUE, ETC.

N.B.—Under the Wireless Telegraphy Act, 1904, the Postmaster-General's authority is necessary before any apparatus for wireless telegraphy is installed or worked.

Formal licences to conduct experiments in wireless telegraphy cannot at present be granted; but, pending the settlement of certain outstanding questions, the Postmaster-General is prepared to authorise the use of wireless apparatus for the reception of signals on the following conditions:—

1. The applicant shall produce evidence of his British nationality and two written references. (A certificate of birth should be furnished if possible; but this will not be insisted upon if the two referees testify of their own knowledge that the applicant is of British nationality. The references should be given by persons of standing, who are British subjects and not related to the applicant.)

2. There shall be no divulgence to any person (other than properly authorised officials of His Majesty's Government or a competent legal tribunal) or any use whatever made of any message received by means of the apparatus;

3. The installation shall be subject to the approval of the Postmaster-General;

4. The aerial shall not exceed the under-mentioned maximum height and dimensions:—

Extreme height of aerial above ground	100 feet.
Total length of wire including leading-in wires	100 feet for single wire aerial; 140 feet of wire where two or more wires are used (<i>e.g.</i> , total length of 70 feet of double wire.)

5. Valves shall not be used without the special authority of the Postmaster-General.

6. The apparatus shall be open to inspection at all reasonable times by properly authorised officers of the Post Office.

7. A fee of 10s. shall be paid. (It is contemplated that an annual charge of 10s. shall be made in respect of each experimental receiving licence to cover the expenses of the issue of the licence and the inspection of the station.)

PROCEDURE TO BE FOLLOWED:

The applicant* should furnish (by letter addressed to the Secretary, G.P.O., E.C.1.):—

- (a) A formal acceptance of the foregoing conditions:—
- (b) Evidence and references as described in (1);
- (c) His full Christian names, age and particulars of his occupation;
- (d) A remittance of 10s.;
- (e) A description of the apparatus which it is proposed to instal, and, if authority is desired for the use of valves, a diagram of the circuits in which they would be used;
- (f) A sketch showing the form, height and dimensions of the proposed aerial (including leading-in wires);
- (g) The address at which the apparatus would be installed.

Any wireless apparatus belonging to the applicant which is in Post Office custody will be released as soon as authority is granted for the use of such apparatus. The production of a permit from the Post Office for the use of wireless receiving apparatus will be sufficient authority for the purchase by the person or firm to whom the permit has been granted of such apparatus as comes within the terms of the permit. The sales in these cases need not be reported to the Post Office by the vendors. If necessary, this form as well as the permit for the use of the apparatus, should be produced for the vendor's inspection.

N.B.—Authority to use wireless apparatus cannot be issued to a minor (*i.e.*, a person under 21 years of age). Application should accordingly be made on his behalf by his parent or guardian who should proceed as indicated above and should, in addition, state his (or her) relationship to the minor. In such cases the evidence and references specified in condition (1) should be furnished BOTH AS REGARDS THE MINOR AND HIS PARENT OR GUARDIAN. There would be no objection to a minor working the authorised apparatus as the agent of his parent or guardian.

○ EXTRACT FROM CONVENTION RELATING TO INTERNATIONAL AIR NAVIGATION (1919):—

ART. 14.—No wireless apparatus shall be carried without a special licence issued by the State whose nationality the aircraft possesses.

* See *Nota Bene* above as regards minors.

Such apparatus shall not be used except by members of the crew provided with a special licence for the purpose.

Every aircraft used in public transport and capable of carrying ten or more persons shall be equipped with sending and receiving wireless apparatus when the methods of employing such apparatus shall have been determined by the International Commission for Air Navigation.

This Commission may later extend the obligation of carrying wireless apparatus to all other classes of aircraft in the conditions and according to the methods which it may determine.

P

LICENCE TO ESTABLISH WIRELESS TELEGRAPH AIRCRAFT STATIONS.

To all to whom these presents shall concern.

I, the Right Honourable

His Majesty's Postmaster-General send greeting :

Whereas by reason of the provisions of the Telegraph Acts 1863 to 1916 and the Air Navigation Regulations 1919 it is unlawful to establish any wireless telegraph station or instal or work any apparatus for wireless telegraphy in any place in the United Kingdom or in any British aircraft except under and in accordance with a licence granted in that behalf by the Postmaster-General :

And whereas

(hereinafter called "the licensee") has applied to the Postmaster-General for the grant of a licence to establish instal and work apparatus for wireless telegraphy as defined in Section I (7) of the Wireless Telegraphy Act 1904 at the aircraft station or stations mentioned in the First Schedule hereto :

Now I the above-named

His Majesty's Postmaster-General in exercise of all powers and authorities enabling me in this behalf do hereby grant to the licensee during the term or period commencing on the day of the date hereof and terminating on the thirty-first day of December one thousand nine hundred and unless and until these presents and the licence or permission hereby given shall be determined as hereinafter provided licence and permission—

I. To establish instal and work for the purposes hereinafter mentioned at the aircraft station or stations specified in the First Schedule hereto apparatus for wireless telegraphy of the kind specified in the Schedules hereto (which apparatus is hereinafter referred to as "the licensed apparatus") ;

II. To send and receive messages by means of the licensed apparatus for the purposes and subject in all respects to the conditions and restrictions contained in the Second Schedule hereto.

And I do hereby declare that the said licence and permission is granted on and subject to the following conditions and provisions :—

1. In these presents (and in the Schedules hereto) the following words and expressions shall have the several meanings hereinafter assigned to them unless there be something either in the subject or context repugnant to such construction (that is to say) :—

The expression "the Postmaster-General" means the Postmaster-General for the time being.

The expression "wireless telegraphy" has the same meaning as in the Wireless Telegraphy Act 1904.

The term "telegraph" has the same meaning as in the Telegraph Act 1869.

The expression "Naval signalling" means signalling by means by any system of wireless telegraphy between two or more ships or aircraft of His Majesty's Navy between ships or aircraft of His Majesty's Navy and Naval stations or between a ship or aircraft of His Majesty's Navy or a Naval station and any other wireless telegraph station.

The expression "Government aircraft signalling" means signalling by means of any system of wireless telegraphy between two or more Government aircraft between any Government aircraft and any wireless station or between any Government aerodrome and any other wireless station.

The expressions "the International Telegraph Convention" and the "International Telegraph Regulations" mean respectively the International Convention of St. Petersburg dated July 10th to 22nd 1875 and the Service Regulations made thereunder and include respectively any modifications of the Convention or Regulations made from time to time.

The expression "the Radiotelegraph Convention 1912" means the Convention signed at London on the 5th day of July 1912 and the Service Regulations made thereunder and includes any modification of the Convention or Regulations made from time to time.

The term "aircraft" includes all balloons, whether fixed or free, airships and flying machines.

The term "ship station" means a wireless telegraph station established on board a ship which is not permanently moored.

2. The licensed apparatus shall not be used by the licensee or by any other person either on behalf or by permission of the licensee for the despatch or receipt of messages except messages authorised by this licence.

3.—(1) The licensee shall not by the transmission of any message by means of the licensed apparatus or otherwise by the use of the licensed apparatus interfere with Naval signalling or Government aircraft signalling.

(2) Whenever the operators at any signal station of the licensees perceive through the medium of the instruments used by them that Naval signalling or Government aircraft signalling is proceeding they shall refrain from using the licensed apparatus until all indication that Naval signalling or Government aircraft signalling is proceeding shall have ceased.

(3) These provisions for the protection of Naval signalling or Government aircraft signalling shall be construed to be without prejudice to the generality of any other provisions of this licence.

4. For the purpose of this licence the licensee shall observe the International Telegraph Convention and the International Telegraph Regulations so far as the said Convention and Regulations are capable of being applied to wireless telegraphy in common with ordinary land and submarine telegraphy.

5. The licensee shall observe the provisions of any Regulations from time to time made under the provisions of the Telegraph Acts 1863 to 1916 by the Postmaster-General with the consent of the Treasury in relation to the conduct of wireless telegraph business so far as the same are applicable to the licensee.

6. The licensee shall observe the provisions of the Radiotelegraph Convention 1912 so far as they are not inconsistent with the other provisions of this licence, the expressions "ship"

and "ship station" in the Convention being read as if "aircraft" and "aircraft station" respectively were substituted therefor.

7. The licensee shall comply with all such directions and observe all such rules as may be given or made by the Postmaster-General from time to time for the purpose of preventing interference with the working of any other wireless telegraph station and for enabling the messages exchanged by means of the licensed apparatus to be distinguished from those emanating from any other wireless telegraph station.

8. The licensee shall comply in all respects with all such directions and regulations as may from time to time be given or made by the Secretary of State for Air.

9. The licensed apparatus shall not without the consent of the Postmaster-General be altered or modified in respect of any of the particulars mentioned in the Schedules hereto.

10. The licensee shall at all times indemnify the Postmaster-General against all actions claims and demands which may be brought or made by any Corporation Company or person in respect of any injury arising from any act licensed or permitted by these presents.

11. The licensee shall so far as possible receive from aircraft ships and light stations all requests for assistance and all signals of distress and shall answer such requests and signals and send them with the least possible delay to the proper authorities by means of the licensed apparatus or any other means in the power of the licensee.

12.—(1) The licensed apparatus at each of the aircraft stations mentioned in the First Schedule hereto shall be worked only by operators holding Air Operators' certificates issued by the Postmaster-General and such operators shall only work the apparatus in accordance with the tenor of the certificate which they hold and subject in all respects to the conditions of this licence.

(2) Air Operators' Certificates will be of two classes a First Class Certificate authorising the holder to work wireless apparatus on aircraft for the sending or receiving of messages in general and a Second Class Certificate authorising the holder to work wireless apparatus on aircraft for the purpose of sending and receiving spoken messages only. Such certificates will be granted to approved natural-born British subjects of such technical proficiency and will be subject to such conditions as the Postmaster-General shall from time to time prescribe and they may be endorsed or withdrawn at the discretion of the Postmaster-General in accordance with the conditions to which the certificates respectively are subject.

13. The licensee shall not divulge to any person (other than properly authorised officials of His Majesty's Government or a competent legal tribunal) or make any use whatever of any message coming to the knowledge of the licensee and not intended for receipt by means of the licensed apparatus. The licensee shall exhibit at each of the stations specified in the Schedule hereto a copy of Section II of the Post Office (Protection) Act 1884 and any contravention of that section by any person in the employment of the licensee shall be deemed to be a breach of the provisions of this licence.

14. The Postmaster-General and any agent authorised in that behalf in writing by him may at all reasonable times enter upon all or any of the aircraft stations hereby licensed for the purpose of inspecting and may inspect any apparatus fixed or being in such stations

respectively for the purpose of sending and receiving messages by wireless telegraphy and all other telegraphic instruments and apparatus fixed or being in such stations respectively and the working and user of such apparatus and telegraphic instruments respectively.

15. The licensee shall carry on every aircraft on which an aircraft station is established under this licence a print or copy of the licence certified under the hand of an appropriate officer of the Postmaster-General to be a true copy and shall produce such print or copy for inspection if required to do so by the competent authorities of the countries where the aircraft calls.

16. The licensee shall forthwith pay to the Postmaster-General for and in respect of the licence hereby granted a royalty of five shillings per annum in respect of each aircraft station at which the licensed apparatus is installed.

17. Except with the consent in writing of the Postmaster-General the licensee shall not assign underlet or otherwise dispose of or admit any other person or body to participate in the benefit of the licences powers or authorities hereby granted or any of such licences powers or authorities.

18.—(1) Inasmuch as an emergency has arisen in which it is expedient for the public service that His Majesty's Government shall have control over the transmission of messages by the licensed apparatus and if and whenever any such emergency shall arise it shall be lawful for any Naval Military Air or Police Officer or any other person authorised by the Secretary of State for Air to take possession of the licensed apparatus or any part thereof in the name and on behalf of His Majesty and to use the same for His Majesty's service and any such officer or person so authorised may enter upon any aircraft on which any such apparatus is installed and take possession of the said apparatus and use the same as aforesaid and subject to such use may use the same or allow it to be used for such ordinary services as may in his discretion seem fit to him or may prohibit and take steps to prevent use of the same and issue directions which shall be obeyed by the licensee to prevent such use.

(2) Any such officer or person so authorised as aforesaid may instead of taking possession of the licensed apparatus as aforesaid direct and authorise such persons as he may think fit to assume the control of the transmission of messages by the licensed apparatus either wholly or partly and in such manner as he may direct and such persons may enter upon any aircraft on which any apparatus is installed accordingly or the said officer or person so authorised as aforesaid may direct the licensee to submit to him or any person authorised by him all messages tendered for transmission or arriving by the licensed apparatus or any class or classes of such messages to stop or delay the transmission of any messages or deliver the same to him or his agent and generally to obey all such directions with reference to the transmission of messages as the said officer or person so authorised as aforesaid may prescribe and the licensee shall obey and conform to all such directions.

(3) The licensee shall be entitled to reasonable compensation for any damage to the licensed apparatus arising in consequence of the exercise of the powers conferred by this clause.

19. The Postmaster-General may at any time in his absolute discretion give notice in writing to determine these presents and the licence or permission hereby granted at the end of

one calendar month from the date of such notice and at the expiration of that period the licence or permission hereby granted shall cease and determine accordingly but without prejudice to any remedy of the Postmaster-General under any condition or provision herein contained.

20. In case of any breach non-observance or non-performance by or on the part of the licensee of any of the provisions or conditions herein contained then and in any such case the Postmaster-General may by notice in writing under his seal revoke and determine these presents and the licences powers and authorities hereinbefore granted and each and every of them as to all or any of the aircraft stations hereby licensed and thereupon these presents and the said licences powers and authorities and each and every of them shall absolutely cease determine and become void as to all or any of the said aircraft stations (as the case may be) but without prejudice to any right of action or remedy which shall have accrued or shall thereafter accrue to the Postmaster-General under any condition or provision herein contained.

21. Nothing in these presents contained shall prejudice or affect the right of the Postmaster-General from time to time to establish extend, maintain and work any system or systems of telegraphic communication (whether of a like nature to that hereby licensed or otherwise) in such manner as he shall in his discretion

think fit neither shall anything herein contained prejudice or affect the right of the Postmaster-General from time to time to enter into agreements for or to grant licences relative to the working and user of telegraphs (whether of a like nature to those hereby licensed or otherwise) or the transmission of messages in any part of the United Kingdom by means of wireless telegraphy or by any other means with or to any person or persons whomsoever upon such terms as he shall in his discretion think fit. And (save as in this licence expressly provided) nothing herein contained shall be deemed to authorise the licensee to exercise any of the powers or authorities conferred on or acquired by the Postmaster-General by or under the Telegraph Acts or any of them.

22. Any notice request or consent (whether expressed to be in writing or not) to be given by the Postmaster-General under these presents may be under the hand of any officer of the Post Office duly authorised by him and may be served by sending the same in a registered letter addressed to the licensee at the usual or last-known place of residence or business of the licensee and any notice to be given by the licensee under these presents may be served by sending the same in a registered letter addressed to the Secretary of the Post Office at the General Post Office London.

As witness my hand and seal this
day of one thousand nine
hundred and

FIRST SCHEDULE.

[illegible]

SECOND SCHEDULE.

PROVISIONS AS REGARDS QUALITIES OF APPARATUS AND CONDITIONS OF WORKING.

1. The licensed apparatus shall be in keeping with scientific and technical requirements as determined by the Postmaster-General from time to time and shall comprise apparatus for sending and receiving messages. The licensed apparatus at each aircraft station shall be properly adjusted in all respects before the aircraft commences its flight.

2. The sending apparatus used at each aircraft station shall be of such a character that the waves emitted are undamped; and the receiving apparatus at each aircraft station

shall be of such a character as to afford the greatest possible protection from disturbance during the reception of messages.

3. The siding apparatus installed at each aircraft station shall be so constructed as to be capable of using waves of 600 metres interrupted-continuous wave (hereinafter referred to as "the Aircraft Ship Wave") and 900 metres continuous wave (hereinafter referred to as "the Aircraft Normal Wave"); it may also be constructed so as to be capable of using the following waves, viz.—220, 300, 450 and 800 metres interrupted-continuous waves and 200 to 500 metres, 650 to 950 metres and 2,000 to 3,000 metres continuous waves : Provided always that, if the apparatus is so

constructed as to be capable of using waves of 2,000 to 3,000 metres. It must also be capable of using 2,400 metres continuous wave: Provided further that the wavelengths before referred to shall not be used without the written permission of the Postmaster-General.

The use of the Aircraft Ship Wave shall be confined to the system known as interrupted undamped wave or tonic train Interrupted Continuous Wave and the Aircraft Normal Wave shall be used only for continuous undamped waves or for the purpose of sending and receiving spoken messages.

4. The wavelengths referred to in this Schedule shall be measured by the standard of measurement for the time being in use by the Postmaster-General.

5. The sending apparatus installed at each aircraft station may be so constructed as to be capable of varying the wave emitted by an amount equal to but not exceeding 3,000 cycles per second above and below the frequency of the normal wave in use: Provided always that such variation from the normal wave shall be used only—

- (a) When first calling up;
- (b) When communication has not been established when first calling up; or
- (c) In case of distress.

6. The receiving apparatus installed at each aircraft station may be constructed so as to receive waves of any length, but it shall be constructed so as to be capable of receiving messages on the Aircraft Ship Wave and the Aircraft Normal Wave: Provided always that if the sending apparatus shall be capable of using the wavelengths mentioned in paragraph 3 of this Schedule the receiving apparatus shall be so constructed as to be capable of receiving messages on these wavelengths.

7. The input of power to the licensed apparatus measured at the terminals of the power generator or battery shall not exceed 100 watts: Provided that when vacuum valves having heated filaments constitute a part of either the sending or receiving apparatus or both the power employed for heating the said filaments shall be excluded in computing the maximum input.

8. The licensed apparatus shall not be used except during actual flight or in case of forced landing.

9. The licensed apparatus may be used for receiving messages on any subject, but shall be used only for sending messages on the following subjects:—

- (a) Distress signals;
- (b) Meteorological information;
- (c) Forced landings and landing instructions;
- (d) Positions;
- (e) Supply of fuel and spare parts;
- (f) Origin, destination, or course of flight.

10. Except with the written permission of the Postmaster-General, the Aircraft Normal Wave and no other wave shall be used for the sending and receipt of messages to and from—

- (a) Other aircraft stations;
- (b) Ground stations specified by the Secretary of State for Air.

11. Except with the written permission of the Postmaster-General, the Aircraft Ship Wave and no other wave shall be used for the sending and receipt—

- (a) Of messages to and from ships of His Majesty's fleet and merchant ships;
- (b) Of such messages as are rendered neces-

sary by reason of exceptional emergency and not coming within the scope of the above-mentioned provisions for the use of the Aircraft Normal Wave.

12. The procedure employed for the sending and receipt of messages to and from each aircraft station and other aircraft stations shall conform to instructions laid down by the Secretary of State for Air.

Signed sealed and delivered by
in the presence of

On behalf of the Postmaster-General

Q WIRELESS DIRECTION FINDING STATIONS.

USE BY THE MERCANTILE MARINER.

ADMIRALTY NOTICE TO MARINERS, No. 524 OF
25TH MARCH, 1920.

The following is promulgated for information—

The Admiralty have recently received evidence from various sources that the existence of Wireless Direction Finding Stations in the United Kingdom, France, Canada, the United States and Germany, and the regulations under which these stations are operated, are not as generally known throughout the Mercantile Marine as is desirable in view of the immense value of the system of wireless direction finding as an aid to navigation, especially in thick and foggy weather.

2. On the other hand, returns rendered by the stations in the United Kingdom show that where the system is known to masters it is beginning to be more extensively used, not only when atmospheric conditions render it impossible to obtain the ship's position by any other means, but as a check on positions obtained by the ordinary method of navigation.

3. Information on this subject was first published in Admiralty Notice to Mariners No. 1,019 of May 23rd, 1919. This Notice has since been revised, and the latest information on the subject is contained in Admiralty Notice to Mariners No. 363 of the year 1920 (reproduced in Board of Trade Notice to Mariners). This Notice should be studied by masters who desire to make use of this system: the procedure to be adopted, which varies to some extent for the different stations and as to the wavelength to be used, is set out therein in detail. It is equally necessary that W/T operators should study the procedure.

4. Briefly put, a ship requiring a bearing calls up the D.F. station or stations from which it is desired to receive a bearing, singly or together, according to the procedure laid down. The station or stations reply with the bearing (true) of the ship from that station.

5. The following stations are established in the United Kingdom: Peterhead, Berwick, Flamborough, Lizard, Amlwch, Rhyl, Carnore, Lame, Seaview (Malin Head).

6. These stations are operated by the Royal Navy, but are available for the use of the Mercantile Marine.

7. A charge of five shillings (5s.) will be made as from April 1st, 1920, for each bearing asked for and given. Thus, if bearings from two stations or two separate bearings from one station were asked for, the charge would be ten shillings (10s.).

8. Charges will be collected by the Accountant-General of the Navy from the Administration controlling and operating the ships concerned, in accordance with the present system of collecting charges for W/T commercial messages.

9. The accuracy with which bearings can be taken depends on certain conditions outlined in the Notice to Mariners referred to, but, although the bearings given by a station within the section over which it is designed to work can generally be considered accurate to within two degrees, it must be distinctly understood that the Admiralty provide this service on the express condition that they incur no liability for any consequences resulting directly or indirectly from any inaccuracy in the bearings given from any failure in the service, or from any other cause whatever.

(Notice No. 524 of 1920, dated March 25th.)

Authority.—The Lords Commissioners of the Admiralty. (H. 2049/20.)

R WIRELESS DIRECTION FINDING STATIONS.

ADMIRALTY NOTICE TO MARINERS, No. 838 OF 22ND MAY, 1920.

1. Wireless direction finding (D.F.) stations are stations set up ashore equipped with receiving apparatus which enables them to ascertain the direction from which wireless signals transmitted by another station emanate.

2. The accuracy with which bearings can be taken depends on the conditions outlined below; but, although in general the bearings taken by a station within the sector over which it is designed to work can generally be considered accurate to within two degrees, the administrations controlling these stations cannot accept any responsibility for the consequences of a bearing being inaccurate.

3. It is, however, pointed out that if at least three D.F. stations can be employed and if they are so situated as to give intersecting bearings, considerable reliance can be placed upon the result of 3 simultaneous bearings thus obtained, provided that the "triangle of error" (sometimes called the "cocked hat") formed by the intersection of the bearings is small.

4. In order to obtain the greatest possible degree of accuracy, it is important that the ship should not transmit with too much power. Signals should, however, be fairly strong and clear; great care must be taken to keep the note and strength steady, and to pay strict attention to spacing.

5. It must be borne in mind that it is impossible for the majority of existing D.F. stations to distinguish between a bearing and its reciprocal (*i.e.*, there is always a possible error of 180°), and that bearings are often unreliable at night and in very bad weather, also when the direction runs roughly parallel with the coast line.

6. The methods of asking for and giving bearings and the waves to be used will shortly be standardised by International agreement; and the particulars of the D.F. stations will eventually appear in the International List of Radiotelegraph Stations. Meanwhile, each country is publishing regulations governing the use of its own D.F. stations as set out below.

7. It should be noted that there are two principal systems of D.F. stations at present in use, *viz.* :—

(a) Where each D.F. station is fitted with transmitting and receiving gear and works independently of others.

(b) Where several D.F. stations (all of them usually near a harbour entrance or difficult passage) are linked together by special land telegraph lines, being thus controlled by one station which alone is fitted with transmitting apparatus. The controlling station in such cases is not necessarily a D.F. station but may be an ordinary coast station.

REGULATIONS FOR CANADIAN AND NEWFOUNDLAND D.F. STATIONS.

8. The following independent D.F. stations are established :—

Station.	Call Signal.	Range (miles).	Lat. N.	Long. W.
Chebucto Head	VAV	250	44 30 01	63 31 20
Canso ..	VAX	100	45 19 24	60 58 25
Cape Race	VAZ	250	46 39 10	53 05 05

9. These stations keep watch and take bearings on the 600-metre wave.*

10. A ship requiring a bearing should call the D.F. station required and transmit a government message requesting the bearing.

Example.—A ship, *s.s. Nonsuch*, call sign XYZ, calls up Chebucto Head in the ordinary way and, on receiving "K" (go on), makes the message as follows :—

"Call" S Radio Nonsuch 1, 5, 10 (day of month) 10.50 M (time)=Officer in Charge Chebucto Head=Request bearing=Master + XYZ.

11. The D.F. station will then acknowledge receipt of the message and, if not ready to take the bearing at once, will direct the ship to wait.

12. When ready to take the bearing, the D.F. station will make "K" (go on), whereupon the ship will make the figure "2" 30 times, commencing with the "Call" and ending with the "Cross" and her own call signal.

13. If the D.F. station is not satisfied with the bearing, it will make the "repeat" sign (?) and the ship will again make the figure "2" as above, but only 20 times.

14. In default of such request for a repetition, the D.F. station does not transmit until it is ready to give the bearing. To do so, the station calls the ship and sends (as a government message) the TRUE bearing of the ship from the station in degrees from 0° to 359°, the angles being measured from true north (0°) clockwise through true east (90°), true south (180°), and true west (270°).

REGULATIONS FOR D.F. STATIONS IN THE UNITED STATES.

15. The following U.S. Naval D.F. stations are now in operation for the purpose of furnishing bearings to vessels in the Western Atlantic. Stations marked * are in continuous operation in foggy weather only.

The stations given in the former Notice, which are not included in the following list, are to be expunged from the charts.

* After 1st August, 1920, the 800 metre wave will be used exclusively both for transmission and reception. See notice "L" under "Canada."

Station.	Call Signal.	Latitude. N.			Longitude. W.

Morris Island, S.C.*	NAO	32	41	36	79	53	17

16. Where two or more of the foregoing D.F. stations have the same call signal it indicates that they are connected by telegraph to and under the control of a central control station the call signal being the call of the central control station. When a request for bearings is made the central control station invariably answers with a bearing from each of the D.F. stations under its control.

17. The following signals have been authorised and will be used until further notice:—

Signal. Meaning.

QTE? .. What is my true bearing?

QTE .. Your true bearing is — degrees from — D.F. station.

18. To obtain bearings, the D.F. station should be called on 800 metres in the usual manner, and the call followed by the signal "QTE?" meaning "What is my true bearing?" When told by the D.F. station to "K" (go ahead), the ship's operator should follow the procedure outlined below:—

(a) Transmit the ship's call signal for 30 seconds.

(b) Make dashes, each dash 5 seconds long, for one minute, with the ship's call signal after each dash.

(c) Terminate with the signal "K" (go ahead).

19. If satisfactory bearings are obtained, the operator at the D.F. station will call the vessel in the usual manner and reply "QTE" followed by the true bearing in degrees (0 to 359) spelled out in words, and the name of the D.F. station from which the bearing was obtained;

otherwise a repetition of the test will be requested.

20. The ship's operator should acknowledge receipt of the bearings by answering the D.F. station in the usual manner and repeat, in numerals, the bearings received. This procedure enables all stations concerned to check the bearings.

21. All United States Naval D.F. stations keep watch and transmit on 800 metres for merchant vessels, and this wavelength should be used for calling and answering and carrying on all communication with these stations.

22. In order that the operation of shore D.F. stations may be checked up, a brief report should be forwarded to the Director, Naval Communications, Navy Department, Washington, D.C., containing:—

(a) Name of ship.

(b) Name of D.F. station.

(c) Date and G.M.T. at which wireless bearing was given.

(d) Bearing given by D.F. station.

(e) Estimated position of ship at above time and date by methods other than wireless.

(f) The probable degree of accuracy of the estimated position.

(g) Weather conditions at above time.

(h) Remarks, if any.

(i) Signature of master or responsible navigating officer.

REGULATIONS FOR D.F. STATIONS IN THE UNITED KINGDOM.

23. The following D.F. stations are established:—

Station.	Call Signal.	Latitude. N.			Longitude. W.		
		°	'	"	°	'	"
Peterhead	BVL	57	33	30	1	49	05
Berwick	BVG	55	41	48	1	53	40
Flamborough	BVN	54	07	05	0	04	58
Amlwch*	BXV	53	24	28	4	18	20
Rhyl*	BZW	53	18	20	3	28	50
Lizard	BVY	49	59	07	5	12	18
Carnsore	BVZ	52	11	50	6	21	00
Larne	BXJ	54	51	15	5	48	15
Seaview†	BXK	55	22	00	7	19	25

* Rhyl is not fitted with transmitting apparatus and is controlled by Amlwch.

† Seaview is not fitted with transmitting apparatus and is controlled by Malin Head (GMH), which keeps watch on 600 metres.

24. All the above D.F. stations keep watch and take bearings on the 450 metres wave (*see note*). Except as shown in the notes they all work as independent stations and can transmit, as well as receive, on 450 metres.

Note.—Ships with Marconi apparatus can adjust their transmitting gear very nearly to this wave (using reduced power) by cutting out half the primary transmitting condenser and adjusting the A.T.I. till the earth lamp shows maximum current in the aerial. The primary slider should be "all in."

25. The actual procedure to be adopted by ships requiring bearings will depend upon what stations are concerned. It should be observed that if the stations to be called do not all keep watch on the same wave (*e.g.*, Malin Head and Larne), bearings should be asked for separately. If on the other hand the stations to be called all keep watch on the same wave (*e.g.*, Lizard and Carnsore), they should be called up together and the bearings taken in one operation. If, however, two or more stations are linked by special land lines (*e.g.*, Amlwch and Rhyl), only one of them should be called up. In such cases, however, the ship must specify in the preliminary signal the D.F. stations which are required to supply bearings.

26. The following abbreviations are to be used:—

Signal.	Meaning.
QTE? ..	"What is my true bearing from you (or from —)?"
QTE ..	"Your true bearing from me (or from —) was — degrees."

27. The ship calls the station or stations on the appropriate wave, making "QTE?" In conjunction, if necessary, with the call signals of the stations from which bearings are required and also (if the call is not made on 450 metres) by the figures "450," signifying that the ship will shift to 450 metres for the taking of the bearing. The ship then awaits instructions.

Example 1.

A ship whose call signal is XYZ requires bearings from Amlwch (BXV) and Rhyl (BZW). The ship, having first shifted to 450 metres, calls Amlwch thus:—

CT BXV BXV de XYZ QTE BXV BZW?
She then awaits instructions.

Example 2.

The ship requires a bearing from Seaview (BXX). The ship has to use 600 metres to call Malin Head (GMH).

She calls on 600 metres, thus:—

CT GMH GMH de XYZ QTE BXX? 450.
She then gets ready to shift to 450 metres and awaits instructions.

28. The station or stations called then make the necessary arrangements and, when ready, answer in alphabetical order of their call signals (if more than one was originally called) and make "K" (go on) preceded by "450" if 450 had been made in the original call.

Example 1.

Amlwch, in Example 1 above, warns Rhyl by land line and, when both are ready, makes on 450 metres:—

CT XYZ de BXV K.

Example 2.

Malin Head, in Example 2 above, warns Seaview by land line and then makes on 600 metres:—

CT XYZ de GMH 450 K.

Malin Head then shifts to 450 metres so as to be ready to give the result when received by wire from Seaview.

29. On receiving "K," the ship, having shifted transmitting wave to 450 metres (if not already done), then makes her own call signal for 45 seconds and awaits the result.

Example 1.

The ship, in Example 1 above, makes on 450 metres:—

CT BXV de XYZ XYZ XYZ, etc.
(for 45 seconds) XYZ.

Example 2.

The same as Example 1, reading GMH for BXV.

30. The station or stations then reply (in alphabetical order if more than one) either asking the ship to repeat (?) or giving the result. The result is given by the signal QTE followed as necessary by the call signal and by a group of three figures (000 to 359) indicating the true bearing from 0° to 359°, reckoned as in paragraph 14, of the ship from the station. Several bearings can be combined into one message, each bearing immediately following the call signal of the station which took it. The time of handing in is always expressed in Greenwich mean time for all messages giving bearings to merchant ships.

Example 1.

Rhyl, in Example 1 above, is not satisfied with the bearing and informs Amlwch. Amlwch makes on 450 metres:—

CT XYZ de BXV?

The ship at once complies by making on 450 metres:—

CT BXV de XYZ XYZ XYZ, etc.
(for 45 seconds) XYZ.

Rhyl is then satisfied that the bearing is 340° and informs Amlwch, while Amlwch finds that its own result is 37°. Amlwch therefore makes on 450 metres:—

CT XYZ XYZ de BXV 1 9.45 M (time)
=QTE BZW 340 BXV 037+BXV.

Example 2.

Seaview, in Example 2 above, gets a satisfactory bearing of 329° and informs Malin Head. The latter makes on 450 metres:—

CT XYZ XYZ de GMH 2 10.46 S (time)
=QTE BXX 329+GMH.

Example 3.

Had the ship merely asked Lizard (BVY) for a bearing, Lizard, finding it to be 246°, would make on 450 metres:—

CT XYZ XYZ de BVY 1 7.6 M (time)
=QTE 246+BVY.

31. The ship, on receiving the result, acknowledges receipt in the ordinary way, and makes the "end of work" sign. This sign is then repeated by the station or stations concerned. It is important that the "end of work" sign should not be omitted, since it not only indicates that the operation is finished, but it also shows that all concerned are about to resume watch on their normal wave.

REGULATIONS FOR FRENCH D.F. STATIONS.

32. The following D.F. stations are established :—

Station.	Call Signal.	Latitude. N.			Longitude. E.		
		°	'	"	°	'	"
Le Havre	FFU	49	31	30	0	07	00 E.

Tréguier	FOC	48	50	08	3	13	56 W.
Ouessant—Pen ar Roch *	PHY	48	26	27	5	05	33 W.
Brest—Guilpavas ..	PHA	48	27	00	4	26	30 W.
Brest—Capucins † ..	HUD	48	19	12	4	34	48 W.
Pointe du Raz	EPU	48	02	22	4	43	52 W.
Lorient	FFL	47	44	05	3	20	45 W.
Chémoulin §	FUH	47	14	06	2	17	54 W.
Rochefort—Soubise ..	HOB	45	56	00	1	00	00 W.
Barre de l'Adour	FLO	43	31	40	1	31	20 W.
Casablanca—Chetaba ‡ ..	FCH	33	35	21	7	34	10 W.

* Ouessant—Pen ar Roch answers FFF.

† Brest—Capucins answers FFK.

‡ Casablanca—Chetaba answers CNP.

§ Chémoulin closed pending transfer to Ville-ès-Martin; near St. Nazaire, of which further notice will be given.

33. The regulations for French D.F. stations are similar to those for the United Kingdom.

REGULATIONS FOR ITALIAN D.F. STATIONS.

34. The following D.F. station is established :—

Station.	Call Signal.	Latitude. N.			Longitude. E.		
		°	'	"	°	'	"
Murano	IRM	45	27	40	12	21	22

Note.—The above station cannot answer the calls from ships, but is in direct communication by telegraph with the W.T. station Carbonera (ICZ).

35. Vessels wishing to obtain bearings from Murano D.F. station must call up Carbonera station, and the latter, having obtained the required information from Murano, will duly transmit it to them. The bearings are True, and are given in degrees from 0° to 359°.

36. The procedure is as follows :—

A ship whose call signal is ABC wishes a bearing.

On a wave of 600 metres she will signal :—

 \overline{CT} ICZ ICZ de ABC QTE ?

Carbonera will answer :—

 \overline{CT} ABC de ICZ \overline{AS}

Carbonera then wires Murano; when ready, Carbonera replies :—

 \overline{CT} ABC de ICZ K 6.

ABC, after 30 seconds, signals :—

 \overline{CT} ICZ de ABC ABC ABC etc., for 45 seconds.

37. If dissatisfied with the bearing, Murano through Carbonera will ask the ship to repeat.

Carbonera signals :—

 \overline{CT} ABC de ICZ \overline{UD} .

ABC repeats the signal as given above.

38. When satisfied with the bearing, which is assumed to be 170°, at 9.45, Murano will transmit it by telegraph to Carbonera, whence it is passed to the ship as follows :—

 \overline{CT} ABC de ICZ de IRM 9.45 M \overline{BT} QTE 170 \overline{AR} ICZ.

ABC acknowledges receipt :—

 \overline{CT} ICZ de ABC R \overline{SK} .

REGULATIONS FOR GERMAN D.F. STATIONS.

39. The following D.F. stations on the German North Sea Coast are established. The stations belong to the State Marine but are also available for public use :—

Station.	Call Signal.	Latitude. N.	Longitude. E.
Wilhelmshaven *	KAN	53 31 00	8 09 30
List	VBD	55 00 12	8 23 12
Nordholz	MNF	53 47 06	8 38 30
Borkum	FNR	53 34 55	6 40 54

* Control station.

40. (a) A ship (call sign ABC) requiring a bearing from each of the three stations, the following procedure is to be employed :—

CT KAN KAN KAN DE ABC AR
 CT ABC ABC ABC DE KAN AR K
 CT KAN DE ABC BT QTE AR
 CT ABC DE KAN VE AS
 CT FNR FNR FNR MNF MNF MNF
 VBD VBD VBD DE KAN BT PEILUNG
 (Bearing)
 600 m—WELLE ABC
 (metre wave)
 CT ABC DE KAN BT BITTE VV GEBEN AR
 (Please send V's)
 CT KAN DE ABC BT V's ABC AR
 CT FNR MNF VBD DE KAN AR K
 CT KAN DE FNR BT PEILUNG ABC . . . GRAD
 (Bearing) (Degrees)
 FNR 1018 AR
 Similarly MNF and VBD pass their bearings to KAN
 CT FNR MNF VBD DE KAN VE
 CT ABC DE KAN BT PEILUNG 1018 ? AR K
 (Have you received Bearing)
 CT KAN DE ABC VE VE AR SK
 CT ABC DE KAN VE SK
 CT FNR MNF VBD DE KAN SK

(b) A ship (call sign ABC) requiring her position to be obtained by means of bearings from the three stations, the following procedure is to be employed :—

With the exception that QTF is substituted for QTE the procedure is as in (a) above until the three stations have passed the bearings to KAN.

KAN then makes to ABC :—

CT ABC DE KAN BT IHR STANDORT NACH
 (your position by means of
 FUNK PEILUNG UM 1018 IST—GRAD
 bearings at is degrees
 —MIN—SEK NORD-BREITE
 minutes seconds north
 —GRAD—MIN—SEK OST-LÄNGE
 degrees minutes seconds east)
 AR K

The procedure is then as in the last 3 lines of (a) above.

41. Note.—Mid-European time is used, the hours and minutes being expressed in four figures from 0000 to 2359.

Note.—This Notice is a revision of former Notice No. 363 of 1920.

(Notice No. 838 of 1920, dated May 22nd.)

ADMIRALTY NOTICE TO MARINERS.

No. 952 OF JUNE 15TH, 1920.

FIXING POSITION BY WIRELESS DIRECTIONAL BEARINGS.

I.—GENERAL.

S Fixing position by directional wireless is very similar to fixing by cross bearings from visible objects, the principal difference being that, when using a chart on Mercator's Projection allowance has to be

made for the curvature of the earth, the wireless stations being generally at very much greater distances than the objects used in an ordinary cross bearing fix.

Although fixing position by wireless directional bearings is dependent for its accuracy upon the degree of precision with which it is at present possible to determine the direction of wireless waves, subsequent confirmation of the course and distance made good, by the receipt of additional bearings, would afford confidence

to those responsible in the vessel as the land is approached under weather conditions that preclude the employment of other methods.

At the present time, from shore stations with practised operators and instruments in good adjustment, the maximum error in direction should not exceed 2° for day working, but it is to be noted that errors at night may be larger, although sufficient data on this point is not at present available.

II.—TRACK OF WIRELESS WAVE.

The track of a wireless wave being a great circle is represented on a chart on Mercator's Projection by a flat curve, concave towards the equator; this flat curve is most curved when it runs in an east and west direction and flattens out as the bearing changes towards north and south. When exactly north and south it is quite flat and is then a straight line, the meridian. The true bearing of a ship from a wireless telegraphy station, or *vice versa*, is the angle contained by the great circle passing through either position and its respective meridian.

III.—CONVERGENCY.

Meridians on the earth's surface not being parallel but converging at the poles, it follows that a great circle will intersect meridians as it crosses them at a varying angle unless the great circle itself passes through the poles (*i.e.*, is a meridian). The difference in the angle formed by the intersection of a great circle with two meridians (*i.e.*, convergency) depends on the angle the great circle makes with the meridian, the middle latitude between the meridians and the difference of longitude between the meridians.

This difference is known as the convergency and can be approximately calculated from the formula:—

Convergency in mins. = diff. long. in minutes $\times \sin$ mid. lat.

Convergency may be readily found from the Convergency Scale attached to this Notice, or it may be found by traverse table entering the D. long. as distance and mid. lat. as course; the resulting departure being the convergency in minutes.

IV.—TRUE AND MERCATORIAL BEARINGS.

Meridians on a Mercator's chart being represented by parallel lines, it follows that the true bearing of the ship from the station, or *vice versa*, cannot be represented by a straight line joining the two positions, the straight line joining them being the mean mercatorial bearing

which differs from the true bearing by $+\frac{1}{2}$ the convergency. As it is this mean mercatorial bearing which we require, all that is necessary when the true bearing is obtained from a W/T station is to add to or subtract from it $\frac{1}{2}$ the convergency and lay off this bearing from the station.

Note.—Charts on the Gnomonic Projection which facilitate the plotting of true bearings are now in course of preparation.

V.—SIGN OF THE $\frac{1}{2}$ CONVERGENCY.

Provided the bearings are always measured in degrees north 0° to 360° (clockwise) the sign of this $\frac{1}{2}$ convergency can be simply determined as follows:—

N. lat. - $\frac{1}{2}$ convergency is + to the bearing by the W/T station when ship is E. of station.

N. lat. - $\frac{1}{2}$ convergency is - to the bearing given by the W/T station when ship is W. of station.

S. lat. - The opposite.

When the W/T station and the ship are on opposite sides of the equator, the factor \sin mid. lat. is necessarily very small and the convergency is then negligible. All great circles in the neighbourhood of the equator appear on the chart as straight lines and the convergency correction as described above is immaterial and unnecessary.

VI.—EXAMPLE.

A ship is by D.R. in lat. $48^\circ 45' N.$, long. $25^\circ 30' W.$, and obtains wireless bearings from Sea View $244\frac{1}{2}^\circ$ and from Ushant $277\frac{1}{2}^\circ$. What is her position?

Sea View - Lat. $55^\circ 22' N.$ Long. $7^\circ 19\frac{1}{2}' W.$
D. R. - " $48^\circ 45' N.$ " $25^\circ 30' W.$

Mid Lat. - $52^\circ 03' N.$ Diff. long. $1090.5'$
Convergency = $1090.5 \times \sin 52^\circ = 859'$ or $\frac{1}{2}$ convergency = $7^\circ 09'$.

The true bearing signalled by Sea View was $244\frac{1}{2}^\circ$, as ship is west of the station (North lat. see paragraph V.), the $\frac{1}{2}$ convergency will be "minus" to the true bearing signalled.

Therefore the mercatorial bearing will be $237\frac{1}{2}^\circ$ nearly.

Similarly with Ushant.

Lat. D. R. - $48^\circ 45' N.$ Long. $25^\circ 30' W.$
" Ushant - $48^\circ 26\frac{1}{2}' N.$ " $5^\circ 05\frac{1}{2}' W.$

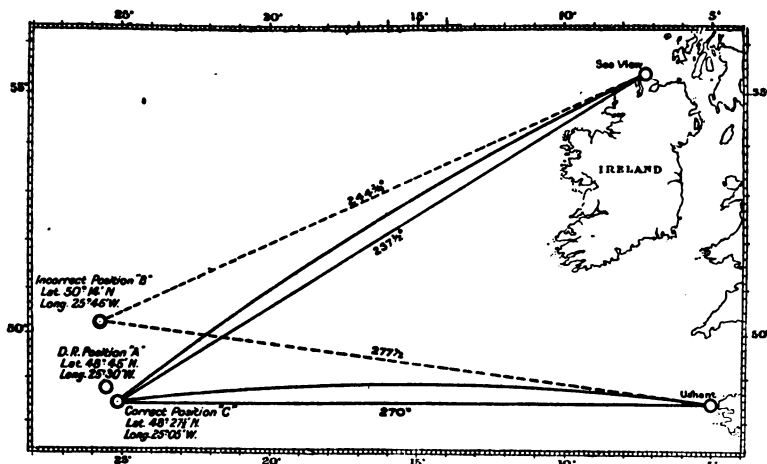

Mid lat. - $48^\circ 36' N.$ Diff. long. $1224.5' W.$
Convergency $1224.5 \times \sin 48^\circ 36' = 919'$ or $\frac{1}{2}$ convergency = $7^\circ 40'$.

The true bearing signalled by Ushant was $277\frac{1}{2}^\circ$, as ship is west of the station (North lat. see paragraph V.), the half convergency will be

Scales for obtaining the Convergency for 10' Diff. Longitude in different Latitudes

Example:— Mid Lat. $50^\circ 30'$, diff. long. 282; To find the Convergency.
Under $50^\circ 30'$ on Mid. Lat. scale read 7.7 on scale of Convergency
which multiplied by 28.2 gives 217' the Convergency

"minus" to the true bearing signalled. Therefore the mercatorial bearing will be 270° nearly.

¶ Laying off $237\frac{1}{2}^\circ$ and 270° on the chart from Sea View and Ushant respectively the intersection will be in :

Lat. $48^\circ 27\frac{1}{4}'$ N., long. $25^\circ 05'$ W., which is the ship's position.

¶ Note.—In plotting the positions the largest scale chart available that embraces the area should be used. A station pointer will be found convenient for laying off the bearings where the distances are great.

The accompanying chartlet drawn on the Mercator's Projection shows the above positions and the error involved by laying off the true bearings as signalled from Sea View W/T station and Ushant W/T station.

The curved lines are the great circles passing through Sea View and ship's position and Ushant and ship's position.

The pecked lines are the true bearings laid off as signalled, their intersection (B) being in lat. $50^\circ 14'$ N., long. $25^\circ 46'$ W., or approximately $110'$ from the correct position.

The straight lines are the mean mercatorial bearings laid off from Sea View and Ushant and their intersection (C) gives the ship's position very nearly, i.e., lat. $48^\circ 27\frac{1}{4}'$ N., long. $25^\circ 05'$ W.

Position A is the ship's D.R. position, lat. $48^\circ 45'$ N., long. $25^\circ 30'$ W., which was used for calculating the $\frac{1}{2}$ convergence.

Note.—As the true position of the ship should have been used to obtain the $\frac{1}{2}$ convergence, the quantity found is not correct, but it could be recalculated using lat. and long. (C) and a more correct value found. This, however, is only necessary if the error in the ship's assumed position is very great.

VII.—ACCURACY OF THIS METHOD OF PLOTTING.

Although this method is not rigidly accurate, it can be used for all practical purposes up to

1,000 miles range, and a very close approximation found to the lines of positions upon which the ship is at the moment the stations receive her signals.

VIII.—USE OF W/T BEARINGS WITH OBSERVATIONS OF HEAVENLY BODIES.

It follows that W/T bearings may be used in conjunction with position lines obtained from observations of heavenly bodies, the position lines from the latter being laid off as straight lines (although in this case also they are not strictly so), due consideration being given to the possible error of the W/T bearings. Moreover, W/T bearings can be made use of at short distances as "position lines" in a similar manner to the so-called "Sumner-line" when approaching port, making the land, avoiding dangers, etc.

IX.—CONVERSE METHOD.

When ships are fitted with apparatus by which they record the wireless bearings of shore stations whose positions are known, the same procedure for laying off bearings from the shore stations can be adopted, but it is to be remembered that in applying the $\frac{1}{2}$ convergence to these bearings it must be applied in the converse way, in both hemispheres, to that laid down in paragraph V.

(Notice No. 952 of 1920.)

AIR MINISTRY NOTICE TO AIRMEN, No. 103, DATED SEPTEMBER 30TH, 1920. ROYAL NAVY WIRELESS DIRECTION FINDING STATIONS.

It is hereby notified :—

The Aircraft may use the Wireless Direction Finding Stations operated by the Royal Navy, under the conditions laid down for the use of these stations by the Mercantile Marine, in Admiralty "Notice to Mariners," No. 524, of March 25th, 1920.

The following stations are established in the United Kingdom:—

Station.	Wave-length.	Call Sign.	Latitude N.	Longitude W.
Amlwch (a)	450 metres	BXV	53 24	4 18
Berwick		BVG	55 42	1 54
Carnsore		BVZ	52 12	6 21
Flamborough		BVN	54 07	0 05
Larne		BXJ	54 51	5 48
Lizard		BVY	49 59	5 12
Peterhead		BVL	57 34	1 49
Rhyl (a)	600 metres	BZW	53 18	3 29
Seaview (b) (Malin Head)		BXX	55 22	7 19

Note.—(a) Rhyl is not fitted with transmitting apparatus, and is controlled by Amlwch.

(b) Seaview has no transmitting apparatus, and is controlled by Malin Head (GMH), which keeps watch on 600 metres.

2. The actual procedure to be adopted by aircraft requiring bearings will depend upon what stations are concerned. It should be observed that if the stations to be called do not all keep watch on the same wave (e.g., Lizard and Carnsore), they should be called up together, and the bearings taken in one operation. If, however, two or more stations are linked by special land lines (e.g., Amlwch and Rhyl) only one of them should be called up. In such cases, however, the aircraft must specify in the preliminary signal the D.F. stations which are required to supply bearings.

3. The following abbreviations are to be used:—

Signal.	Meaning.
QTE? ..	"What is my true bearing from you (or from —)?"
QTE ..	"Your true bearing from me (or from —) was — degree."

4. The aircraft calls the station or stations, on the appropriate wave, making "QTE?" in conjunction, if necessary, with the call signals of the stations from which bearings are required; and also (if the call is NOT made on 450 metres) by the figures "450," signifying that the aircraft will shift to 450 metres for the taking of the bearing. The aircraft then awaits instructions.

Example 1.

An aircraft whose call signal is XYZ requires bearings from Amlwch (BXV) and Rhyl (BZW). The aircraft, having first shifted to 450 metres, calls Amlwch thus:—

CT BXV BXV de XYZ QTE BXV BZW?
The aircraft then awaits instructions.

Example 2.

The aircraft requires a bearing from Seaview (BXX). The aircraft has to use 600 metres to call Malin Head (GMH).

The aircraft calls on 600 metres, thus:—

CT GMH GMH de XYZ QTE BXX? 450

The aircraft then gets ready to shift to 450 metres and awaits instructions.

5. The station or stations called then make the necessary arrangements, and, when ready, answer in alphabetical order of their call signals (if more than one was originally called), and make "K" (go on) preceded by "450" if 450 had been made in the original call.

Example 1.

Amlwch, in Example 1 above, warns Rhyl

by land line, and, when both are ready, makes on 450 metres:—

CT XYZ de BXV K.

Example 2.

Malin Head, in Example 2 above, warns Seaview by land line and then makes on 600 metres:—

CT XYZ de GMH 450 K.

Malin Head then shifts to 450 metres, so as to be ready to give the result when received by wire from Seaview.

6. On receiving "K," the aircraft, having shifted transmitting wave to 450 metres (if not already done), then makes her own call signal for 45 seconds, and awaits the result.

Example 1.

The aircraft, in Example 1, para. 4, makes on 450 metres:—

CT BXV de XYZ XYZ CYZ, etc. (for 45 seconds) XYZ.

Example 2.

The same as Example 1, reading GMH for BXV.

7. The station or stations then reply (in alphabetical order if more than one) either asking the aircraft to repeat (?) or giving the result. The result is given by the signal QTE, followed, as necessary, by the call signal and by a group of three figures (000 to 359) indicating the true bearing from 0° to 359° of the aircraft from the station. Several bearings can be combined into one message, each bearing immediately following the call signal of the station which took it. The time of handing in is always expressed in Greenwich mean time for all messages giving bearings to aircraft.

Example 1.

Rhyl, in Example 1 above, is not satisfied with the bearing and informs Amlwch. Amlwch makes on 450 metres:—

CT XYZ de BXV?

The aircraft at once complies by making on 450 metres:—

CT XYZ de XYZ XYZ XYZ, etc. (for 45 seconds) XYZ.

Rhyl is then satisfied that the bearing is 340° and informs Amlwch, while Amlwch finds that its own result is 37°. Amlwch therefore makes on 450 metres:—

CT XYZ XYZ de BXV 1 9.45.M (time)
= QTE BZW 340 BXV 037+BXV.

Example 2.

Seaview, in Example 2 above, gets a satis-

factory bearing of 329° and informs Malin Head. The latter makes on 450 metres :—

CT XYZ XYZ de GMH 2 ro.46 S (time)
=QTW BXX 329+GMH.

Example 3.

Had the aircraft merely asked Lizard (BVV) for a bearing, Lizard, finding it to be 246° would make on 450 metres :—

CT XYZ XYZ de BVV 1 7.6 M (time)
=QTE 246+BVV.

8. The aircraft, on receiving the result, acknowledges receipt in the ordinary way and makes the "end of work" sign. This sign

is then repeated by the stations concerned. It is important that the "end of work" sign should not be omitted, since it not only indicates that the operation is finished, but it also shows that all concerned are about to resume watch on their normal wave.

9. Further information on this subject is contained in Admiralty "Notices to Mariners," Nos. 363 of February 25th, 1920; 524 of March 25th, 1920, and 838 of May 22nd, 1920, which should be consulted.

By Command of the Air Council,
W. F. NICHOLSON.

*Air Ministry, London, W.C. 2.
September 30th, 1920.*

UNITED STATES OF AMERICA

THE declaration of independence of the States of the American Union was adopted by Congress, July 4th, 1776. The Constitution of September 17th, 1787, lays down the basis of government under which (modified by amendments in 1787, 1791, 1798, 1804, 1865, 1868, 1870 and 1913) this great and powerful Republic is now governed.

The Union comprises 48 STATES, each of which is provided with a Legislature of two Houses, a Governor at the head of the Executive and a judicial system. The district of Columbia (D.C.) is the seat of the Federal Government, and was provided by the State of Maryland for this purpose in 1791. It is co-extensive with the City of Washington, and embraces an area of 60 miles. The TERRITORIES of Alaska and Hawaii are governed by local Legislatures, whose Acts may be modified or annulled by Congress. The grand total of the superficies governed under the U.S.A. Constitution amounts to 3,574,658 square miles.

N.B.—There are, moreover, DEPENDENCIES administered by the U.S.A. Government. Their rule is undertaken by a Governor and staff appointed by the President. Porto Rico and the Philippines belong to this division, although provided with Representative Government. Guam, in the Marianne Archipelago (Pacific Ocean), and the Samoan Islands are pure Dependencies administered by the U.S. Navy Department. Wireless in all these instances is controlled by the Navy Department in war time, but in peace time the radio stations of Porto Rico, Hawaii and Alaska are under the jurisdiction of the Department of Commerce, and all commercial transmitting radio stations operated in these dependencies must be licensed by this Department, and the operators of such stations must also be licensed.

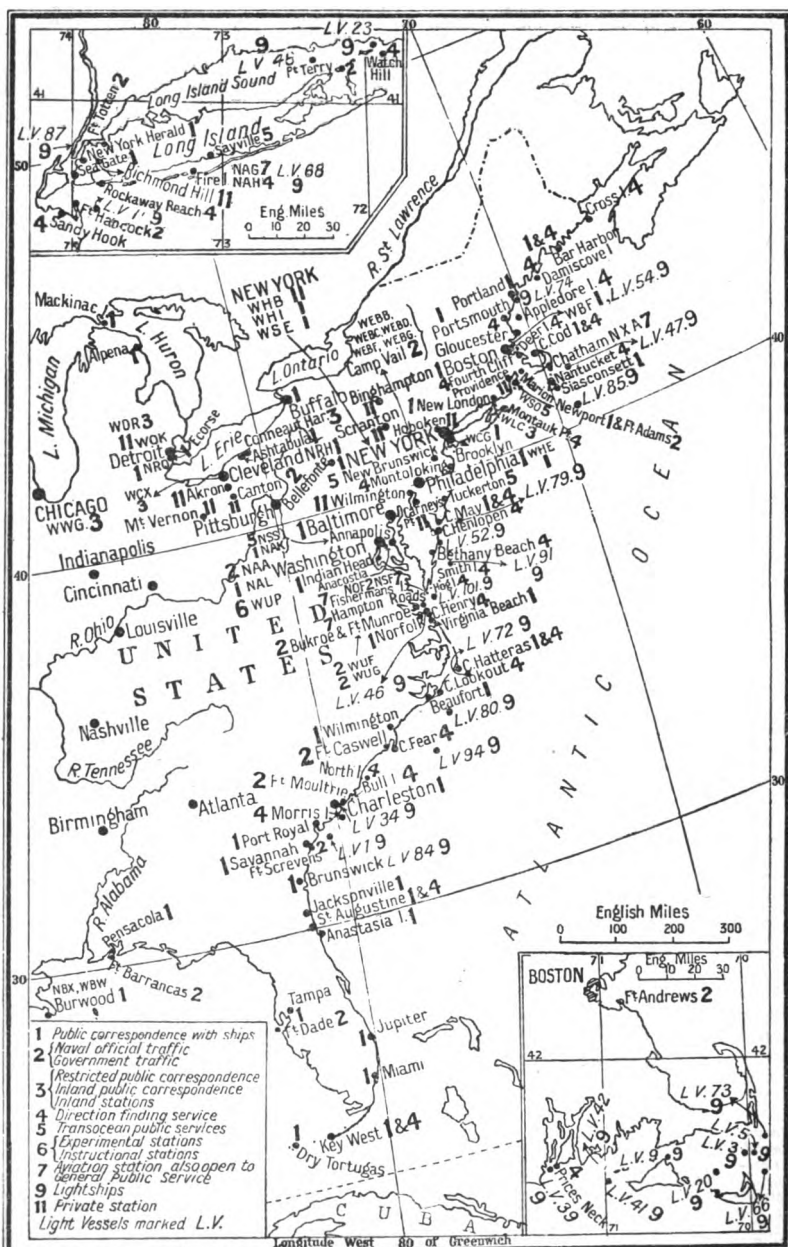

The "CANAL ZONE" on the Isthmus of Panama ranks as a Dependency, but it has been judged best to print the wireless particulars relating thereto separately under the heading "Panama—Canal Zone."

CONTROL.

The Congress of the United States has delegated to the Department of Commerce the duty of the enforcement of the Wireless Communication Laws and the International Radio-telegraph Convention, and the work is handled through the Bureau of Navigation, Washington.

OFFICIALS CONTROLLING WIRELESS TELEGRAPHY.

Officials.	Title.	Address.
<i>Navy—</i> Rear-Admiral W. H. G. Bullard, U.S.N.	Director of Naval Communications ..	Washington
<i>Army—</i> Maj.-Gen. Sir G. O. Squier, K.C.M.G ..	Chief Signal Officer	Washington
<i>Commerce—</i> Mr. Joshua W. Alexander	Secretary of Commerce	Washington
Mr. E. F. Sweet	Assistant Secretary of Commerce	Washington
Mr. E. T. Chamberlain	Commissioner of Navigation	Washington
Mr. A. J. Tyrer	Deputy Commissioner of Navigation	Washington
Mr. W. D. Terrell	Chief Radio Inspector	Washington

COPYRIGHT GEOGRAPHIA LTD 55 FLEET STREET LONDON E.C.4

There are, in addition, seventeen inspectors and assistant inspectors, stationed at various districts established by the Bureau of Navigation.

ORGANISATION.

In September and October, 1899, Senatore (then Mr.) Marconi installed a radio station for the purpose of reporting the International yacht races between the yachts *Shamrock* and *Columbia*. The *New York Herald* of October 1st, 1899, tells how wireless was used for sending bulletins from the steamships *Ponce* and *Grande Duchesse*, which followed the contending yachts.

According to the most reliable information obtainable, the first regularly operated radio stations in the United States were at Siasconset (Nantucket), Mass., and on Nantucket Shoals Lightship No. 66, work on which was started early in the summer of 1901. These stations were not experimental, or demonstrational, or temporary stations, but were erected for the particular purpose of providing for the regular daily transmission of ship news, and for regular communication and exchange of messages with vessels equipped with similar apparatus. They were owned and operated by the *New York Herald*, and were equipped with Marconi apparatus purchased from, and installed by, the English Marconi Company.

The *New York Herald* of August 17th, 1901, contained an account of how the first radiotelegraphic station at Siasconset got into communication by wireless with the Nantucket Shoals Lightship. The latter, on August 16th, received from the s.s. *Lucania*, of the Cunard Line, at a distance of 72 miles, the first connected wireless message ever radiated to the United States from an approaching vessel. That message ran, "All well on board."

In 1899 (the same year as that of the first wirelessly reported yacht races) the matter of establishing radio services in the TERRITORY of HAWAII was receiving official attention. It was not until March 1st, 1901, however, that radio stations on the island were opened for business, the apparatus being supplied with power by Marconi induction coils. On October 15th, 1908, a 10-kw. station was erected at Kahuku Point, in Oahu (Hawaii) and at that time this was probably the most powerful station on the Pacific. Uninterrupted night communication was established with the wireless station on Telegraph Hill, San Francisco, California, a distance of 2,100 miles. This constituted the first direct radio communication between Hawaii and the U.S.A. On April 1st, 1915, a wireless service was established between the station at Wahiawa, Oahu (Hawaii), and the United States Naval Station at Tuluila, Samoa (2,400 miles distant). A composite system of equipment was used, with a transformer input of 6-kw., and a reliable nightly service has been maintained ever since.

In the TERRITORY of ALASKA radio communication takes the place of wired telegraph and telephone services. The large fish-canning companies rely almost exclusively upon their radio installations for communication between their canning plants, and for the maintenance of touch with their vessels engaged in this industry. Static interference (or atmospherics) is practically unknown there.

The number of wireless stations (excluding amateur installations) licensed in the United States at June 30th, 1920, totalled 5,972.

At June 30th, 1920, the *Government* shore wireless stations numbered 135, of which eighty-eight are in continental United States, twenty in Alaska, nineteen in the Philippines, three in the Canal Zone, two in Hawaii, and one each in Puerto Rico, Guam and Samoa. The *Government* ship stations total 470.

In practically every city of any size in the United States there are one or more radio clubs, composed of men interested in radiotelegraphy from a scientific standpoint, practical radio men, and amateur radio experimenters.* The most important of these clubs is the Institute of Radio Engineers

* For a list of the principal Clubs and Societies see Amateur section of this volume.

(particulars regarding which may be obtained from the Year-Book published in New York by the Institute).

ADMINISTRATION.

In 1910 an effort to regulate radio communication in the United States was made, when a Bill was prepared and passed by the Senate. It was not reached on the House of Representatives calendar, and therefore did not become effective.

The first Act requiring radioapparatus on certain passenger-carrying vessels was approved June 24th, 1910. Under this Act the Secretary of Commerce and Labour organised on July 1st, 1911, the radio service, composed of three inspectors, with headquarters at New York, N.Y., Baltimore, Md., and San Francisco, Cal.

The second Act, approved July 23rd, 1912, amended the above Act and is printed below.

The Act to regulate radio communication was approved August 13th, 1912. Under this Act transmitting stations and radio operators are licensed by the Secretary of Commerce. Transmitting stations are inspected to ascertain whether they comply with the requirements of the law. Radio operators are examined in order to determine their qualifications.

In addition to the above-mentioned Acts, the Department also enforces the London International Radiotelegraphic Convention rules of 1912, to which the United States is a party.

On March 4th, 1913, the Act abolishing the Department of Commerce and Labour and creating the Department of Commerce and the Department of Labour became effective. The enforcement of the radio laws was placed under the jurisdiction of the Secretary of Commerce.

V—Public Resolution No. 48, dated June 5th, 1920.

A An Act approved July 23rd, 1912, amending section 1 of an Act entitled "An Act to require apparatus and operators for radio communication on certain ocean steamers," approved June 24th, 1910.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled.

"SEC. 1. That from and after October first, nineteen hundred and twelve, it shall be unlawful for any steamer of the United States or of any foreign country navigating the ocean

or the Great Lakes and licensed to carry, or carrying, fifty or more persons, including passengers or crew or both, to leave or attempt to leave any port of the United States unless such steamer shall be equipped with an efficient apparatus for radio communication, in good working order, capable of transmitting and receiving messages over a distance of at least one hundred miles, day or night. An auxiliary power supply, independent of the vessel's main electric power plant, must be provided which will enable the sending set for at least four hours,

to send messages over a distance of at least one hundred miles, day or night, and efficient communication between the operator in the radio room and the bridge shall be maintained at all times.

"The radio equipment must be in charge of two or more persons skilled in the use of such apparatus, one or the other of whom shall be on duty at all times while the vessel is being navigated. Such equipment, operators, the regulation of their watches, and the transmission and receipt of messages, except as may be regulated by law or international agreement, shall be under the control of the master, in the case of a vessel of the United States; and every wilful failure on the part of the master to enforce at sea the provisions of this paragraph as to equipment, operators, and watches shall subject him to a penalty of one hundred dollars.

"That the provisions of this section shall not apply to steamers plying between ports, or places, less than two hundred miles apart."

SEC. 2. That this Act, so far as it relates to the Great Lakes, shall take effect on and after April first, nineteen hundred and thirteen, and so far as it relates to ocean cargo steamers shall take effect on and after July first, nineteen hundred and thirteen: *Provided*, That on cargo steamers, in lieu of the second operator provided for in this Act, there may be substituted a member of the crew or other person who shall be duly certified and entered in the ship's log as competent to receive and understand distress calls or other usual calls indicating danger, and to aid in maintaining a constant wireless watch so far as required for the safety of life.

The remaining sections of the Act of June 24th, 1910, which are unchanged, read as follows:—

SEC. 2. That for the purpose of this Act apparatus for radio communication shall not be deemed to be efficient unless the company installing it shall contract in writing to exchange, and shall, in fact, exchange, as far as may be physically practicable, to be determined by the master of the vessel, messages with shore or ship stations using other systems of radio communication.

SEC. 3. That the master or other person being in charge of any such vessel which leaves or attempts to leave any port of the United States in violation of any of the provisions of this Act shall, upon conviction, be fined in a sum not more than five thousand dollars, and any such fine shall be a lien upon such vessel, and such vessel may be labelled therefor in any district court of the United States within the jurisdiction of which such vessel shall arrive or depart, and the leaving or attempting to leave each and every port of the United States shall constitute a separate offence.

SEC. 4. That the Secretary of Commerce shall make such regulations as may be necessary to secure the proper execution of this Act by collectors of customs and other officers of the Government.

B AN ACT TO REGULATE RADIO COMMUNICATION.

APPROVED AUGUST 13TH, 1912.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That a person, company or corporation within the jurisdiction of the United States shall not use or operate any apparatus for radio communication as a means of commercial intercourse among the several States, or with foreign nations, or upon any vessel of the United

States engaged in interstate or foreign commerce, or for the transmission of radiograms or signals the effect of which extends beyond the jurisdiction of the State or Territory in which the same are made, or where interference would be caused thereby with the receipt of messages or signals from beyond the jurisdiction of the said State or Territory, except under and in accordance with a licence, revocable for cause, in that behalf granted by the Secretary of Commerce upon application therefor; but nothing in this Act shall be construed to apply to the transmission and exchange of radiograms or signals between points situated in the same State: *Provided*, That the effect thereof shall not extend beyond the jurisdiction of the said State or interfere with the reception of radiograms or signals from beyond said jurisdiction; and a licence shall not be required for the transmission or exchange of radiograms or signals by or on behalf of the Government of the United States, but every Government station on land or sea shall have special call letters designated and published in the list of radio stations of the United States by the Department of Commerce. Any person, company, or corporation that shall use or operate any apparatus for radio communication in violation of this section, or knowingly aid or abet another person, company, or corporation in so doing, shall be deemed guilty of a misdemeanour, and on conviction thereof shall be punished by a fine not exceeding five hundred dollars, and the apparatus or device so unlawfully used and operated may be adjudged forfeited to the United States.

SEC. 2.—That every such licence shall be in such form as the Secretary of Commerce shall determine and shall contain the restrictions, pursuant to this Act, on and subject to which the licence is granted; that every such licence shall be issued only to citizens of the United States or Porto Rico or to a company incorporated under the laws of some State or Territory or of the United States or Porto Rico, and shall specify the ownership and location of the station in which said apparatus shall be used and other particulars for its identification and to enable its range to be estimated; shall state the purpose of the station, and, in case of a station in actual operation at the date of passage of this Act, shall contain the statement that satisfactory proof has been furnished that it was actually operating on the above-mentioned date; shall state the wavelength or the wavelengths authorised for use by the station for the prevention of interference and the hours for which the station is licensed for work; and shall not be construed to authorise the use of any apparatus for radio communication in any other station than that specified. Every such licence shall be subject to the regulations contained herein, and such regulations as may be established from time to time by authority of this Act or subsequent Acts and treaties of the United States. Every such licence shall provide that the President of the United States in time of war or public peril or disaster may cause the closing of any station for radio communication and the removal therefrom of all radio apparatus, or may authorise the use or control of any such station or apparatus by any department of the Government, upon just compensation to the owners.

SEC. 3.—That every such apparatus shall at all times while in use and operation as afore-

said be in charge or under the supervision of a person or persons licensed for that purpose by the Secretary of Commerce. Every person so licensed who in the operation of any radio apparatus shall fail to observe and obey regulations contained in or made pursuant to this Act or subsequent Acts or treaties of the United States, or any one of them, or who shall fail to enforce obedience thereto by an unlicensed person while serving under his supervision, in addition to the punishments and penalties herein prescribed, may suffer the suspension of the said licence for a period to be fixed by the Secretary of Commerce not exceeding one year. It shall be unlawful to employ any unlicensed person or for any unlicensed person to serve in charge or in supervision of the use and operation of such apparatus, and any person violating this provision shall be guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not more than one hundred dollars or imprisonment for not more than two months, or both, in the discretion of the court for each and every such offence: *Provided*, That in case of emergency the Secretary of Commerce may authorise a collector of customs to issue a temporary permit, in lieu of a licence, to the operator on a vessel subject to the radio ship Act of June 24th, 1910.

Sec. 4.—That for the purpose of preventing or minimising interference with communication between stations in which such apparatus is operated, to facilitate radio communication, and to further the prompt receipt of distress signals, said private and commercial stations shall be subject to the regulations of this section. These regulations shall be enforced by the Secretary of Commerce through the collectors of customs and other officers of the Government as other regulations herein provided for.

The Secretary of Commerce may, in his discretion, waive the provisions of any or all of these regulations when no interference of the character above mentioned can ensue.

The Secretary of Commerce may grant special temporary licences to stations actually engaged in conducting experiments for the development of the science of radio communication, or the apparatus pertaining thereto, to carry on special tests, using any amount of power or any wavelengths, at such hours, and under such conditions as will ensure the least interference with the sending or receipt of commercial or Government radiograms, of distress signals and radiograms, or with the work of other stations.

In these regulations the naval and military stations shall be understood to be stations on land.

REGULATIONS.

Normal Wavelength.

C 1. Every station shall be required to designate a certain definite wavelength as the normal sending and receiving wavelength of the station. This wavelength shall not exceed 600 metres or it shall exceed 1,600 metres. Every coastal station open to general public service shall at all times be ready to receive messages of such wavelengths as are required by the Berlin Convention. Every ship station, except as hereinafter provided, and every coast station open to general public service, shall be prepared to use two sending wavelengths, one of 300 metres and one of 600 metres, as required by the International Convention in

force: *Provided*, That the Secretary of Commerce may, in his discretion, change the limit of wavelength reservation made by regulations first and second to accord with any international agreement to which the United States is a party.

Other Wavelengths.

2. In addition to the normal sending wavelength all stations, except as provided herein after in these regulations, may use other sending wavelengths: *Provided*, That they do not exceed 600 metres or that they do exceed 1,600 metres: *Provided further*, That the character of the waves emitted conforms to the requirements of regulations 3 and 4 following.

Use of a "Pure Wave."

3. At all stations if the sending apparatus, to be referred to hereinafter as the "transmitter," is of such a character that the energy is radiated in two or more wavelengths, more or less sharply defined, as indicated by a sensitive wavemeter, the energy in no one of the lesser waves shall exceed 10 per cent. of that in the greatest.

Use of a "Sharp Wave."

4. At all stations the logarithmic decrement per complete oscillation in the wave trains emitted by the transmitter shall not exceed two-tenths, except when sending distress signals or signals and messages relating thereto.

Use of "Standard Distress Wave."

5. Every station on shipboard shall be prepared to send distress calls on the normal wavelength designated by the international convention in force, except on vessels of small tonnage unable to have plants insuring that wavelength.

Signal of Distress.

6. The distress call used shall be the international signal of distress • • • — — — • • •

Use of "Broad Interfering Wave" for Distress Signals.

7. When sending distress signals, the transmitter of a station on shipboard may be tuned in such a manner as to create a maximum of interference with a maximum of radiation.

Distance Requirement for Distress Signals.

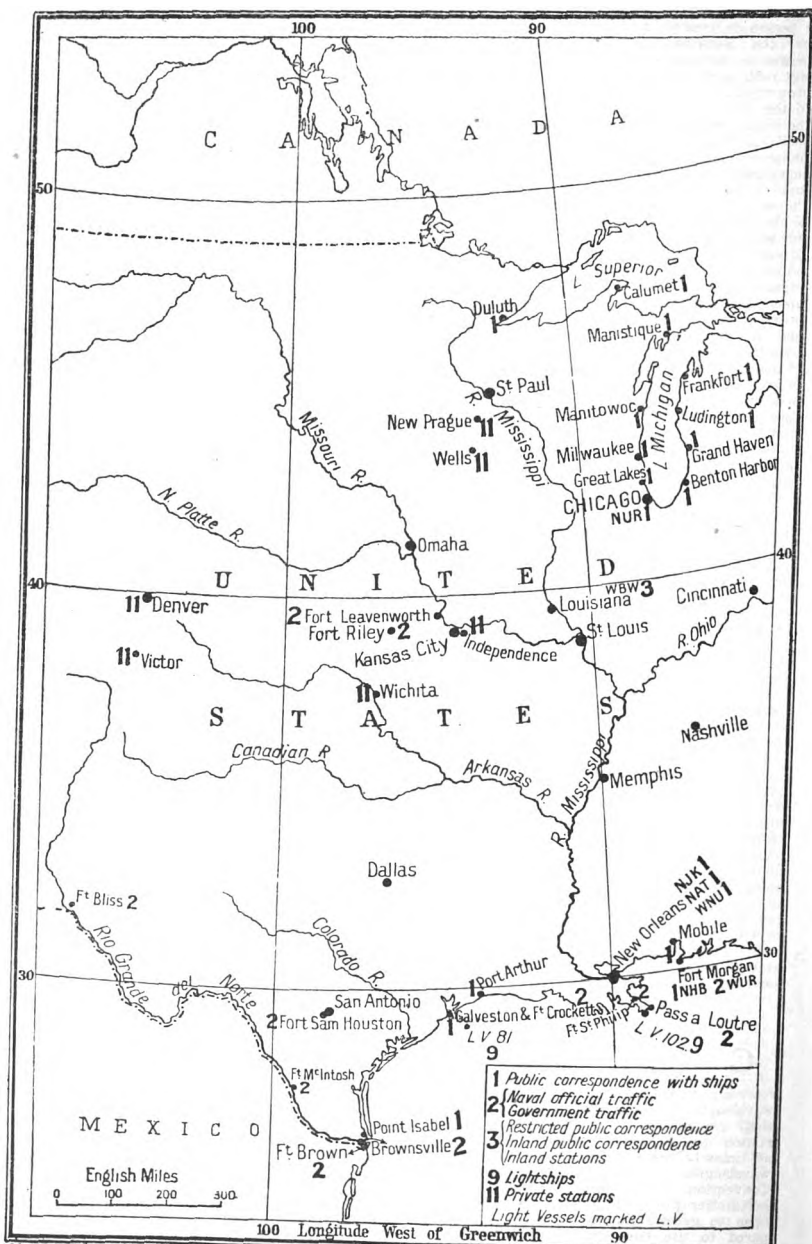

8. Every station on shipboard, wherever practicable, shall be prepared to send distress signals of the character specified in regulations 5 and 6 with sufficient power to enable them to be received by day over sea a distance of 100 nautical miles by a shipboard station equipped with apparatus for both sending and receiving equal in all essential particulars to that of the station first mentioned.

"Right of Way" for Distress Signals.

9. All stations are required to give absolute priority to signals and radiograms relating to ships in distress; to cease all sending on hearing a distress signal; and, except when engaged in answering or aiding the ship in distress, to refrain from sending until all signals and radiograms relating thereto are completed.

Reduced Power for Ships near a Government Station.

10. No station on shipboard when within fifteen nautical miles of a naval or military station shall use a transformer input exceeding 1 kw., nor, when within five nautical miles of such a station, a transformer input exceeding $\frac{1}{2}$ kw., except for sending signals of distress, or signals or radiograms relating thereto.

COPYRIGHT GEOGRAPHIA L^{td} 55 FLEET STREET LONDON E.C. 4.

Intercommunication.

11. Each shore station open to general public service between the coast and vessels at sea shall be bound to exchange radiograms with any similar shore station and with any ship station without distinction of the radio systems adopted by such stations, respectively, and each station on shipboard shall be bound to exchange radiograms with any other station on shipboard without distinction of the radio systems adopted by each station, respectively.

It shall be the duty of each such shore station, during the hours it is in operation, to listen-in at intervals of not less than fifteen minutes, and for a period not less than two minutes, with the receiver tuned to receive messages of 300 metre wavelengths.

Division of Time.

12. At important seaports and at all other places where naval or military and private or commercial shore stations operate in such close proximity that interference with the work of naval and military stations cannot be avoided by the enforcement of the regulations contained in the foregoing regulations concerning wavelengths and character of signals emitted, such private or commercial shore stations as do interfere with the reception of signals by the naval and military stations concerned shall not use their transmitters during the first fifteen minutes of each hour, local standard time. The Secretary of Commerce may, on the recommendation of the department concerned, designate the station or stations which may be required to observe this division of time.

Government Stations to Observe Division of Time.

13. The naval or military stations for which the above-mentioned division of time may be established shall transmit signals or radiograms only during the first fifteen minutes of each hour, local standard time, except in case of signals or radiograms relating to vessels in distress, as hereinbefore provided.

Use of Unnecessary Power.

14. In all circumstances, except in case of signals or radiograms relating to vessels in distress, all stations shall use the minimum amount of energy necessary to carry out any communication desired.

General Restrictions on Private Stations:

15. No private or commercial station not engaged in the transaction of bona fide commercial business by radio communication or in experimentation in connection with the development and manufacture of radio apparatus for commercial purposes shall use a transmitting wavelength exceeding 200 metres or a transformer input exceeding 1 kw., except by special authority of the Secretary of Commerce contained in the licence of the station: *Provided*, That the owner or operator of a station of the character mentioned in this regulation shall not be liable for a violation of the requirements of the third or fourth regulations to the penalties of one hundred dollars or twenty-five dollars, respectively, provided in this section unless the person maintaining or operating such station shall have been notified in writing that the said transmitter has been found, upon tests conducted by the Government, to be so adjusted as to violate the said third and fourth regulations, and opportunity has been given to said owner or operator to adjust said transmitter in conformity with said regulations.

Special Restrictions in the Vicinities of Government Stations.

16. No station of the character mentioned in regulation 15 situated within five nautical miles of a naval or military station shall use a transmitting wavelength exceeding 200 metres or a transformer input exceeding $\frac{1}{2}$ kw.

Ship Stations to Communicate with Nearest Shore Stations.

17. In general, the shipboard stations shall transmit their radiograms to the nearest shore station. A sender on board a vessel shall, however, have the right to designate the shore station through which he desires to have his radiograms transmitted. If this cannot be done, the wishes of the sender are to be complied with only if the transmission can be effected without interfering with the service of other stations.

Limitations for Future Installations in Vicinities of Government Stations.

18. No station on shore not in actual operation at the date of the passage of this Act shall be licensed for the transaction of commercial business by radio communication within fifteen nautical miles of the following naval or military stations, to wit: Arlington, Virginia; Key West, Florida; San Juan, Porto Rico; North Head and Tatoosh Island, Washington; San Diego, California; and those established or which may be established in Alaska and in the Canal Zone; and the head of the department having control of such Government stations shall, so far as is consistent with the transaction of governmental business, arrange for the transmission and receipt of commercial radiograms under the provisions of the Berlin Convention of 1906, and future International Conventions or treaties to which the United States may be a party, at each of the stations above referred to, and shall fix the rates therefor, subject to control of such rates by Congress. At such stations and wherever and whenever shore stations open for general public business between the coast and vessels at sea under the provisions of the Berlin Convention of 1906 and future International Conventions and treaties to which the United States may be a party shall not be so established as to insure a constant service day and night without interruption, and in all localities wherever or whenever such service shall not be maintained by a commercial shore station within 100 nautical miles of a naval radio station, the Secretary of the Navy shall, so far as is consistent with the transaction of governmental business, open naval radio stations to the general public business described above, and shall fix rates for such service, subject to control of such rates by Congress. The receipts from such radiograms shall be covered into the Treasury as miscellaneous receipts.

Secrecy of Messages.

19. No person or persons engaged in or having knowledge of the operation of any station or stations, shall divulge or publish the contents of any messages transmitted or received by such station, except to the person or persons to whom the same may be directed or their authorised agent, or to another station employed to forward such message to its destination, unless legally required so to do by the court of competent jurisdiction or other competent authority. Any person guilty of divulging or publishing any message, except as herein provided, shall, on conviction thereof,

be punished by a fine of not more than two hundred and fifty dollars or imprisonment for a period of not exceeding three months, or both fine and imprisonment, in the discretion of the court.

Penalties.

For violation of any of these regulations, subject to which a licence under sections 1 and 2 of this Act may be issued, the owner of the apparatus shall be liable to a penalty of one hundred dollars, which may be reduced or remitted by the Secretary of Commerce and for repeated violations of any of such regulations the licence may be revoked.

For violation of any of these regulations, except as provided in regulation 19, subject to which a licence under section 3 of this Act may be issued, the operator shall be subject to a penalty of twenty-five dollars, which may be reduced or remitted by the Secretary of Commerce, and for repeated violations of any such regulations, the licence shall be suspended or revoked.

Sec. 5.—That every licence granted under the provisions of this Act for the operation or use of apparatus for radio communication shall prescribe that the operator thereof shall not wilfully or maliciously interfere with any other radio communication. Such interference shall be deemed a misdemeanour, and upon conviction thereof the owner or operator, or both, shall be punishable by a fine of not to exceed five hundred dollars or imprisonment for not to exceed one year, or both.

Sec. 6.—That the expression "radio-communication" as used in this Act means any system of electrical communication by telegraphy or telephony without the aid

of any wire connecting the points from and at which the radiograms, signals, or other communications are sent or received.

Sec. 7.—That a person, company, or corporation within the jurisdiction of the United States shall not knowingly utter or transmit, or cause to be uttered or transmitted, any false or fraudulent distress signal or call or false or fraudulent signal, call, or other radiogram of any kind. The penalty for so uttering or transmitting a false or fraudulent distress signal or call shall be a fine of not more than two thousand five hundred dollars or imprisonment for not more than five years, or both, in the discretion of the court for each and every such offence, and the penalty for so uttering or transmitting, or causing to be uttered or transmitted, any other false or fraudulent signal, call, or other radiogram shall be a fine of not more than one thousand dollars or imprisonment for not more than two years, or both, in the discretion of the court, for each and every such offence.

Sec. 8.—That a person, company, or corporation shall not use or operate any apparatus for radio communication on a foreign ship in territorial waters of the United States otherwise than in accordance with the provisions of sections 4 and 7 of this Act, and so much of section 5 as imposes a penalty for interference. Save as aforesaid, nothing in this Act shall apply to apparatus for radio communication on any foreign ship.

Sec. 9.—That the trial of any offence under this Act shall be in the district in which it is committed, or if the offence is committed upon the high seas or out of the jurisdiction of any particular State or district the trial shall be in

the district where the offender may be found or into which he shall be first brought.

Sec. 10.—That this Act shall not apply to the Philippine Islands.

Sec. 11.—That this Act shall take effect and be in force on and after four months from its passage.

D REGULATIONS GOVERNING SHIP AND LAND RADIO STATIONS.

SHIP STATIONS.

1. On vessels coming under the Ship Acts, an emergency power supply, independent of the vessel's main electric power plant, must be provided which will enable radio messages to be sent for at least four hours over a distance of at least 100 miles day or night. The emergency power supply and equipment should be located and installed in such manner as to afford maximum protection against accident.

2. The radio transmitting apparatus operated from the emergency power supply, should be capable of functioning within two minutes after unexpected notice to the operator.

3. The complete equipment must be maintained in an efficient condition at sea.

4. The complete emergency equipment should be tested before each sailing and daily at sea by the operator or an inspector and a note of its performance entered in the radio log.

5. Radio inspectors or other duly authorised officers of the Government will occasionally call for test messages to be sent by means of the emergency apparatus, while the vessel is at sea.

6. An "induction coil" connected to "plain aerial" is not recommended as emergency apparatus on account of the high voltages produced which frequently damage the antenna insulation and on account of "vibrator troubles."

7. A motor generator or rotary converter operated by storage battery is probably the most satisfactory means available at present of energising the transmitting apparatus.

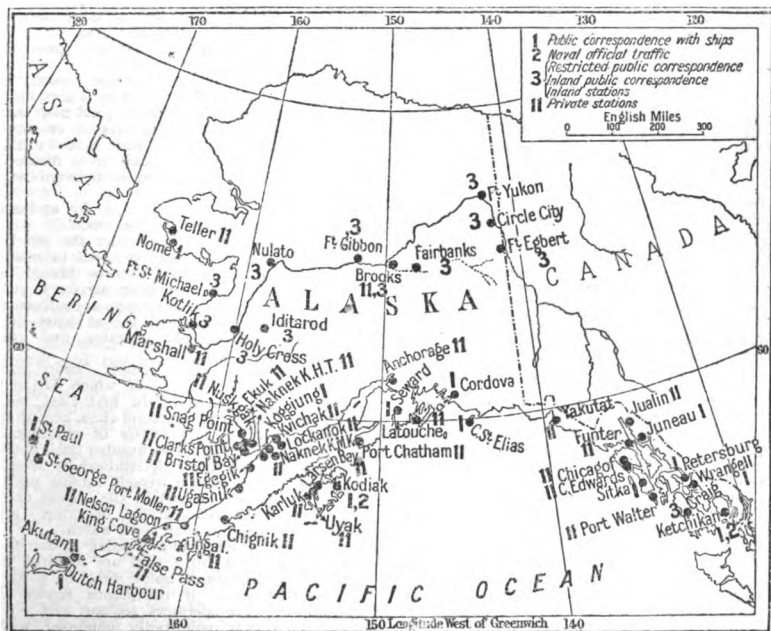

8. Any auxiliary engine for wireless purposes must operate on a fuel which will fulfil the requirements of Rule XI, section 5, of the General Rules and Regulations of the Steamboat Inspection Service, reading as follows:—

None of the inflammable articles specified in section 4472, Revised Statutes, or oil that will not stand a fire test of 300° F. shall be used as stores on any pleasure steamer or steamer carrying passengers except that vessels not carrying passengers for hire may transport gasoline or any of the products of petroleum for use as a source of motive power for motor boats or launches of such vessels (Sec. 4472, R.S.)

9. Every ship station shall carry a reasonable number of spares of such parts of both the main and emergency radiotelegraph equipments as are subject to undue wear, deterioration, or liability to accident.

10. One extra pair of head telephones, extra cords, and extra detectors must always be kept on hand.

11. A storage battery voltmeter, hydrometer, a supply of electrolyte, and distilled water should be part of the regular equipment, but are not prescribed in terms by statute. The absence of these and similar inexpensive

COPYRIGHT "GEOGRAPHIA" LTD 55 FLEET STREET LONDON E.C.4.

emergency articles will be brought to the attention of the master and of the company installing the apparatus by the radio inspector, in writing, and if after a reasonable interval they have not been supplied, the inspector will communicate the fact to the Commissioner of Navigation.

12. The vessel's electric power for the operation of the main equipment shall, at all times while the steamer is under way, be available for the radio operator's use. On steamers where the dynamo is not run continuously there should be an efficient means of communication between the radio room and the dynamo room, in order that the radio operator may signal for power, as the law provides that he may not leave his post of duty.

13. Efficient communication between the radio room and the bridge must be maintained. A speaking tube or telephone will comply with this requirement. A bell and messenger service will not be acceptable unless there are special conditions justifying this equipment. The speaking tube or telephone must terminate in the radio room and on the bridge, or in the chart room if readily accessible from the bridge. If the radio room is adjacent to or accessible from the bridge so that orders may be transferred direct, no means of communication will be required. Any arrangement calling for the services of a third person to transmit the messages will not be satisfactory. The radio inspectors will notify the ship authorities whether the means of communication provided is satisfactory at the time of inspection.

14. On vessels of the United States it is the statutory duty of the master to see that one operator is on duty at all times. The radio service of the ship is under the supreme authority of the master.

15. Masters should require operators on duty to communicate with the officer on the bridge every half-hour.

16. Operators must make entries on the radio log every fifteen minutes, as evidence that a continuous watch is being maintained. The entries must, if possible, consist of the call letters of other stations communicating and a few words of the intercepted messages.

17. When vessels are in port the key to the radio room must at all times be on board in charge of the proper officer and the radio equipment shall be in such condition as to facilitate Government inspection.

CLASSIFICATION OF SHIP STATIONS AND GRADES OF OPERATORS REQUIRED.

18. First Class: Vessels having a continuous service. There shall be placed in the first-class vessels which are intended to carry twenty-five or more passengers:

(1) If they have an average speed in service of fifteen knots or more.

(2) If they have average speed in service of more than thirteen knots, but only subject to the two-fold condition that they have on board 200 persons or more (passengers and crew), and that, in the course of their voyage, they go a distance of more than 500 sea miles between any two consecutive ports.

19. Second Class: Vessels having a continuous watch but a service of limited duration. Other vessels placed in the second-class must, during navigation, maintain a continuous watch for at least seven hours a day, and a watch of ten minutes at the beginning of every other hour.

20. Third Class: Vessels which have no fixed periods of service. All vessels which

are placed neither in the first nor in the second-class shall be placed in the third-class.

21. *Service* may be defined as preparedness to transmit and receive radio messages or signals at the rate of at least twenty words per minute.

22. *Watch* may be defined as preparedness to receive distress signals and call letters slowly. A "watcher" or cargo-grade operator will summon a first or second-class operator if necessary.

23. All American vessels required by the Act of July 23rd, 1912, to be equipped with radio apparatus, and operators must at all hours maintain a continuous watch; that is to say, an operator or *watcher* must be "listening-in" continuously. This requirement is outside of and above the requirement based on the classification under which the ship's station is licensed.

24. Vessels voluntarily equipped are not required to maintain this continuous watch. Vessels voluntarily equipped are, however, subject to the following requirements as to watch according to the class assigned to them in their station licences.

25. If a licence of the second class be issued to a voluntarily equipped vessel, the station must maintain a continuous watch for at least seven hours a day and a watch of ten minutes at the beginning of every hour.

26. The grade of operators required on vessels of each class are prescribed in the London Convention Service Regulations, Article X. A continuous watch may be maintained by one commercial second-grade operator and one cargo-grade operator on cargo steamers.

27. Passenger vessels coming under the Act of July 23rd, 1912, which carry or are licensed to carry twenty-five or more passengers, must be placed in the first class:

(a) If they have an average speed in service of fifteen knots or more.

(b) If they have an average speed in service of more than thirteen knots, but only subject to the twofold condition that they have on board 200 persons or more (passengers and crew), and that in the course of their voyage they go a distance of more than 500 sea miles between any two consecutive ports.

The service shall be carried on by at least two commercial first-grade operators.

28. Cargo vessels coming under the Act of July 23rd, 1912, which are required to maintain a continuous watch, must be placed in the second class if continuous service is not maintained. On cargo steamers a continuous watch may be maintained by at least one commercial second-grade operator and one cargo-grade operator.

29. Passenger vessels coming under the act of July 23rd, 1912, but which are not required to be entered in the first class, may be entered in the first or second class, according to whether continuous service or continuous watch is maintained. The number and grade of operators required is determined by service or watch. On passenger vessels coming under the Ship Act but entered in the second class at least two second-grade operators are required to maintain continuous watch.

30. Cargo vessels which coming under the Act of July 23rd, 1912, and are required to maintain a continuous watch, may be placed in the first class, if continuous service is maintained. (For operators, see par. 28.)

31. All vessels voluntarily equipped with radio apparatus and which have no specified

hours of service or watch must be placed in the third class.

32. Any vessel voluntarily equipped may be placed in the first class if continuous service is maintained, or in the second class if a continuous watch, or a watch of limited duration, such as specified above for vessels of the second class is maintained.

33. In all ship stations transmissions shall be made only by operators holding commercial first or second grade licences or higher.

34. Commercial service shall be maintained by not lower than commercial first-grade operators.

35. Vessels which are voluntarily equipped with radio apparatus for their own convenience and for the correspondence of officers and crew must employ at least one commercial second-grade operator or higher.

36. Radio telephone apparatus on vessels not coming under the Act of July 23rd, 1912, must be operated by a person holding a cargo-grade licence or higher.

37. The owners of ship stations desiring to change the classification of a ship must apply for a new licence.

LAND-STATIONS.

38. Coast stations are stations which transmit messages to vessels at sea or on the Great Lakes, or whose operations can interfere with the exchange of messages between ship and ship or ship and coast. The principal purpose of the regulation of radio communication, international and national, is to secure the greatest efficiency of maritime communication through this agency, especially as a means of promoting safety to life.

39. Inland stations are stations which cannot transmit messages to vessels at sea or on the Great Lakes and whose operations cannot affect the transmission of messages between ship and ship or ship and coast. This may be due to their geographical location or to their range, dependent on power and aerial, or conditions. In some instances actual inspection may be necessary to determine whether a station should be licensed as a coast station or an inland station. An operator or owner in doubt as to the classification of his station should communicate the facts to the radio inspector of his district when applying for a licence.

40. Stations are bound to give absolute priority to calls of distress from ships, to similarly answer such calls, and to take such action with regards thereto as may be required.

41. The working of stations shall be organised as far as possible in such manner as not to disturb the service of other stations.

42. All coast stations (par. 38), excepting general and restricted amateur stations, are required to be able to transmit on the wavelengths of 300 and 600 metres for the purpose of transmitting or relaying distress messages or signals and messages relating thereto, if necessary.

43. Coast stations primary intended for long waves and long-distance transmission may install an auxiliary antenna and auxiliary transmitter to comply with the short wavelength requirements.

44. The international standard wavelength is 600 metres, and the operators of all coast stations are required, during the hours the station is in operation, to "listen-in" at intervals of not less than fifteen minutes and for a period of not less than two minutes, with the receiving apparatus tuned to receive

this wavelength, for the purpose of determining if any distress signals or messages are being sent and to determine if the transmitting operations of the "listening stations" are causing interference with other radio communication.

45. General public service may be defined as "paid business," conducted on commercial wavelengths between ship and shore or ship and ship.

46. Limited public service may be defined as "paid business" between certain designated land stations, ships or lines of ships, and must be conducted on some authorised wavelength other than 300 or 600 metres.

47. All special service must be conducted on some authorised wavelength other than 300 or 600 metres, not interfering with general public service.

48. Limited commercial, special amateur, and all stations which have no authorised rates, shall not transmit or accept public correspondence from other stations, except in case of emergency.

49. If a general public-service coast station also maintains a limited commercial service with other stations on land or with vessels at sea, the limited commercial service must be conducted on some authorised wavelength other than 300 or 600 metres, but this service can be authorised on a general public-service coast station licence without stating the specific hours, it being understood that the limited commercial service is conducted only when no general public service business is on file.

50. If a general public-service coast station also maintains a public service between fixed points on land, the service between the land stations must be conducted on some authorised wavelength other than 300 or 600 metres, and a separate form, No. 761, should be submitted covering "Limited public service," giving the exact hours of such service.

CLASSIFICATION OF LAND STATIONS AND GRADES OF OPERATORS REQUIRED.

51. Both coast stations (the word "coast stations," "shore stations," and "coastal stations" are used interchangeably) and inland stations are divided for the purposes of the administration of the Act into the following classes:

- (1) Public-service stations—
 - (a) General.
 - (b) Limited.
- (2) Limited commercial stations.
- (3) Experiment stations for the development of radio communication.
- (4) Technical and training school station.
- (5) Special amateur stations.
- (6) General amateur stations.
- (7) Restricted amateur stations.

52. CLASS I.—(a) *Public-Service stations, general*, are those open to general business between coast and ships and include those operated by common carriers under the Act of February 4th, 1887, to regulate commerce, amended June 18th, 1910. They are required to maintain a constant service when open. Every coastal station open to public service shall at all times be ready to receive messages of such wavelengths as are required by the International Convention in force. (Sec. 4, Regulation 1, Act of August 13th, 1912.) The station rates are authorised in the licence and published in the Official Berne List. Whenever such stations do not insure a constant

service, transmitting and receiving day and night without interruption, the Secretary of the Navy is directed to open naval radio stations within 100 miles thereof to public business. (Sec. 4, Regulation 18, Act of August 13th, 1912.) The Secretary of War is authorised by the Act of May 26th, 1900 (31 Stat., 206), to open Alaskan military stations to public service.

53. General public service shall be conducted only by operators holding commercial first-grade licences or higher.

54. CLASS 1.—(b) *Public-service stations, limited*, are reserved for a limited public service, determined by the object of the correspondence or other circumstances independent of the system employed. Stations of this class transmit and receive public messages to and from certain stations only, which are designated in the licence. The rates are authorised in the licences, and if not published in the official list they may be obtained from the licensee.

55. The service of limited public service coast stations shall be carried on by commercial first-grade operators or higher.

56. The service of limited public service inland stations shall be carried on by commercial second-grade operators or higher.

57. CLASS 2.—*Limited commercial stations* are not open to public service and are licensed for a specific commercial service or services defined in the licence. Stations of this class must not transmit to or accept public messages from other stations. No rates are authorised.

58. If a coast station, the operators shall hold a commercial second-grade licence or higher. (Par. 57.)

59. CLASS 3.—*Experiment stations*.—The Secretary of Commerce is authorised by section 4 of the Act to grant special temporary licences "to stations actually engaged in conducting experiments for the development of the science of radio communication, or the apparatus pertaining thereto, to carry on special tests, using any amount of power or any wavelengths, at such hours and under such conditions as will insure the least interference with the sending or receipt of commercial or Government radiograms, of distress signals and radiograms, or with the work of other stations." Applicants for such licences should state any technical result they have already produced, their technical attainments, etc. The fact that an applicant desires to experiment with his equipment does not justify or require a licence of this class. Most experiments can be made within the limitations of general and restricted amateur station licences or by use of an artificial antenna to prevent radiation.

60. Experiment stations may be operated by a person holding an experiment and instruction grade licence or higher.

61. CLASS 4.—*Technical and training-school stations* will be licensed, according to the degree of technical training attained and imparted and to local conditions.

62. The grade of operators required will be specified when the licence is issued.

63. CLASS 5.—*Special amateur stations* may be licensed by the Secretary of Commerce to use a longer wavelength and a higher power on special application. Applications for this class from amateurs with less than two years' experience in actual radio communication will not be approved. The application must state the experience and purpose of the

applicant, the local conditions of radio communication, especially of maritime radio communication in the vicinity of the station, and a special licence will be granted only if some substantial benefit to the art or to commerce apart from individual amusement seems probable. (Sec. 4, Regulation 15, Act of August 13th, 1912.)

64. Special amateur coast stations must be operated by a person holding a commercial second-grade licence or higher. Inland stations may be operated by persons holding amateur second-grade licences or higher.

65. CLASS 6.—*General amateur stations* are restricted to a transmitting wavelength not exceeding 200 metres and a transformer input not exceeding 1 kw. (Sec. 4, Regulation 15, Act of August 13th, 1912.)

66. CLASS 7.—*Restricted amateur stations*, within five nautical miles of a naval or military station, are restricted to a wavelength not exceeding 200 metres and to a transformer input not exceeding $\frac{1}{2}$ kw. (Sec. 4, Regulation 16, Act of August 13th, 1912.)

67. Amateur first or second grade operators or higher are required for general and restricted amateur stations.

68. The licence does not specify the number of operators required, but provides that the station shall at all times while in operation be under the care of an operator licensed for that purpose. The grade and number of operators as required by law is determined by the service of the station.

69. *Special stations for exceptional distances* are land stations designed to carry on trans-oceanic radio communication as between the United States and European countries, or between the Pacific coast and Hawaii, or from the United States over similar long distances at sea to another land station, or (inland) to carry on radio communication overland over exceptional distances. These stations will all come under one of the classifications named above and the licence will indicate the stations for which communication is authorised and indicate the range.

REGULATIONS COMMON TO LAND AND SHIP STATIONS.

70. Any change in the characteristics of the radio apparatus or service of the station must be authorised by the Secretary of Commerce.

71. Every land and ship station open to general public service shall have, as a part of the station equipment, a copy of the Official Berne List of Radiotelegraph Stations and supplements thereto, as issued to comply with section 2 of the Act of July 24th, 1910. Information concerning the use of this list and method of procuring it is given on page 72, paragraph 196.

72. The service regulations of the London Convention, Article VII, paragraphs 1 and 2b, require a reduction of power or range under certain conditions. A proper resistance, impedance coil, or reactance regulator in the primary circuit is recommended. In certain cases the reduction of voltage or decreasing of coupling may be approved upon recommendations of radio inspectors.

73. Persons or corporations holding licences for radio stations, either land or ship, if practicable, must submit the licence to the radio inspector for the district, whenever the station or vessel goes out of commission for a period exceeding three months. The Commissioner of Navigation should be notified promptly of any

intention to suspend or discontinue the service of any commercial station.

74. If there is no intention to resume the same service or if the station or vessel will enter a different service from that indicated by the licence, the radio inspector will submit the licence to the Bureau, together with a statement of the facts. Otherwise the radio inspector may retain the licence in his files for safe keeping until the date of its expiration, when it will be forwarded to the Bureau for cancellation.

75. When the station goes into commission the owner may apply to the radio inspector for the return of the licence. The radio inspector will satisfy himself that the station corresponds to the schedule of the station as shown in the licence, and if so, the licence will be returned.

76. Stations desiring to conduct tests should communicate with the radio inspector by letter or telephone, stating the probable length of time that will be required. Stations conducting such tests or temporary experiments should "listen-in," to determine that no interference is being caused, and during the tests should "listen-in" frequently for the interference signal, "QRM." Stations conducting tests should transmit their official call signal frequently. Attention is invited to the Act of August 13th, 1912, section 5:

That every licence granted under the provisions of this Act for the operation or use of apparatus for radio communication shall prescribe that the operator thereof shall not wilfully, or maliciously interfere with any other radio communication. Such interference shall be deemed a misdemeanour, and upon a conviction thereof the owner or operator, or both, shall be punishable by a fine not to exceed five hundred dollars or imprisonment for not to exceed one year, or both.

77. The Department holds that interference caused by tests of the character described above (par. 76) is "wilful" when no "listening-in" precautions are taken and the call signal of the station sending is not repeated at intervals.

APPLICATIONS FOR SHIP AND LAND STATION LICENCES, RENEWALS, AND DUPLICATES.

78. The Act does not apply either afloat or ashore to—

(a) Apparatus for radio communication which merely receives radiograms and is not equipped for sending.

(b) Apparatus for the transmission of radiograms exclusively between points in the same State, if the effect of such transmission does not extend beyond the State (so as to interfere with the radio communication of other States), or if the effect of such transmission does not interfere with the reception of radiograms from beyond the State (so as to interfere with the interstate radio communication of that State).

(c) Apparatus for radio communication which has been issued to the Organised Militia by the War Department or to the Naval Militia by the Navy Department and is used for official purposes only.

79. The owner or operator of any apparatus who may be in doubt whether his apparatus, under this paragraph, is exempt from licence may write the facts to the radio inspector for his district before applying for a licence.

80. The apparatus for transmission of radiograms, or signals on any vessel of the United

States not permanently moored, requires a licence.

81. Apparatus for radio communication on land within the jurisdiction of the United States (excluding the Philippine Islands and excluding apparatus of the Government of the United States) must be licensed if—

(a) The apparatus is a means of commercial intercourse among the several States or with foreign nations; or

(b) The apparatus transmits radiograms or signals the effect of which at any time extends beyond the State; or

(c) The apparatus interferes with the receipt of messages in any State from beyond such State.

82. Station licences for the use and operation of apparatus for radio communication under the Act may be issued only to citizens of the United States or Porto Rico or to a company incorporated under the laws of some State or Territory or of the United States or Porto Rico.

83. Licences can be issued to clubs if they are incorporated or if a member will accept the responsibility for the operation of the apparatus, carrying with it the possibility of being penalised for infraction of the laws.

84. Applications for station licences of all classes should be addressed to the United States Radio Inspector for the district in which the station is located, who will forward the necessary blank forms and information. The limits of the districts and addresses of radio inspectors are given on page 68, paragraph 166.

85. Upon receipt of the forms, properly completed, the radio inspector will make a thorough inspection of the station if practicable.

86. When applications and forms have been properly submitted, ship and amateur stations may be operated in accordance with the laws and regulations governing the class of station for which application for licence has been made, until such time as the application can be acted upon unless the applicant is otherwise instructed and provided temporary official call letters are assigned.

87. General and restricted amateur-station licences are issued directly by radio inspectors. Station licences of all other classes are issued from the office of the Commissioner of Navigation, Department of Commerce. Applications and forms are forwarded by radio inspectors with recommendations by them.

88. Stations desiring to operate different portions of the day under different classifications shall submit application for each service, giving exact hours for each. If approved, each classification will be specified in the licence.

89. The owner of an amateur station may operate his station in accordance with the laws if his application for a licence has been properly filed, but has not been acted upon. An application for an operator's licence must also have been filed, and every effort made to obtain the licence before the station may be operated.

90. "Provisional" station licences are issued to amateurs remote from the headquarters of the radio inspector of the district in which the station is located. These licences are issued as a matter of convenience and record. If, under inspection, the station is found to comply with the law, the inspector will strike out the word "Provisional" and insert the

date of inspection and his signature at the bottom of the licence.

91. If such a station is found not to comply with the law the provisional licence may be cancelled until such time as the apparatus is readjusted to meet the requirements of the law: *Provided, however*, That consideration will be given to any reports of interference filed against such a station.

92. All persons are warned that it is unlawful to operate stations after licences have expired unless application for renewal has been properly made.

93. Owners desiring to renew licences must complete new forms as prescribed for original applications. Amateur-station licences issued on current forms may be renewed by the following endorsement on the back, provided no changes in the equipment or location have been made; otherwise a new licence will be issued: "This licence renewed for one year.

Radio Inspector." The Commissioner of Navigation will be notified of the name and call signal in every case of renewal in this manner.

94. Any person applying for a duplicate licence to replace an original which has been lost, mutilated, or destroyed will be required to submit an affidavit to the Bureau of Navigation through the radio inspector of the district, attesting the facts regarding the manner in which the original was lost. The Commissioner of Navigation will consider the facts in the case and advise the radio inspector in regard to the issue of a duplicate licence or a duplicate will be forwarded through the inspector's office.

95. A duplicate licence will be issued under the same serial number as the original and will be marked "Duplicate" in red across the face.

REGULATIONS GOVERNING RADIO OPERATORS.

GRADES AND REQUIREMENTS.

E 96. (1) Commercial extra first grade; (2) commercial first grade; (3) commercial second grade; (4) commercial cargo grade; (5) commercial temporary permit; (6) experiment and instruction grade; (7) amateur first-grade; (8) amateur second grade.

97. The Service Regulations of the International Convention require that "the service of the station on shipboard shall be carried on by a telegraph operator holding a certificate issued by the Government to which the vessel is subject."

98. Such certificates shall attest the professional efficiency of the operator as regards—

(a) Adjustment of the apparatus and knowledge of its functioning;

(b) Transmission and acoustic reception at the rate of not less than twenty words a minute (Continental Morse) for commercial first-grade operators and not less than twelve words per minute for second-grade operators;

(c) Knowledge of the regulations governing the exchange of wireless telegraph correspondence.

(d) The certificate shall furthermore state that the Government has bound the operator to secrecy with regard to the correspondence.

99. The International Convention has been ratified by the principal maritime nations, dominions and provinces. Radio operators holding valid certificates issued by foreign

Governments which are parties to the convention will be recognised by this department as persons "skilled in the use of such apparatus" within the meaning of the Act, unless in the case of a specific individual there may be special reason to doubt the operator's skill and reliability. Such certificates should be ready at hand for the inspection of radio inspectors or customs officers before the steamer departs from the United States.

100. In the case of a vessel subject to the Act under the flag of any nation not a party to the International Convention, the radio operator, before the departure of the vessel from the United States, must furnish to the inspector evidence that he is "skilled in the use of the apparatus." This evidence shall consist of an examination on board by the radio inspector.

101. *Commercial extra first grade.*—The Department of Commerce will issue a special licence, to be known as commercial extra first grade to radio operators whose trustworthiness and efficient service entitle them to confidence and recognition.

102. These licences will be given consideration by the Civil Service Commission in examinations for positions requiring knowledge of radiotelegraphy, when experience is rated as a part of such examinations.

103. Applicants for the commercial extra first-grade licence must pass a special examination. To be eligible for this examination they must hold commercial first-grade licences, and their certificates of skill in radio communication, issued under the Act of June 24th, 1910, or licences under the Act of August 13th, 1912, must record eighteen months' satisfactory commercial service at sea or at land stations, either or both, during the two years previous to the filing of the application for examination, as shown by endorsement on the licence service records, or other satisfactory evidence, and provided that the applicants have not been penalised for a violation of the radio laws and regulations.

104. A speed of at least thirty words per minute, Continental Morse, and twenty-five words per minute, American Morse (five letters to the word), must be attained. The technical questions and the questions on the radio laws and regulations will be considerably wider in scope than those for commercial first grade, and a higher percentage will be required.

105. All examination papers, including the code test sheets, will be marked and forwarded to the Commissioner of Navigation, with a recommendation by the radio inspector or examining officer. Examination papers will be marked upon the basis of 100, and licences will be recommended only if eighty or better is attained.

106. Licences of this grade will be issued by the Commissioner of Navigation, endorsed by the Secretary of Commerce, and delivered to the successful applicant through the examining officer.

107. *Commercial first grade.*—The applicant must pass a satisfactory examination in—

(a) The adjustment, operation, and care of the apparatus, including correction of faults and change from one wavelength to another.

(b) Transmitting and receiving by ear at a speed of not less than twenty words a minute in Continental Morse (five letters to the word).

(c) Use and care of storage battery or other auxiliary power apparatus.

(d) Knowledge of the international regulations in force applying to radio communication.

(e) Knowledge of the requirements of the Acts of Congress to regulate radio communication (secs. 3, 4, 5, 6, and 7 of the Act of August 13th, 1912).

108. The commercial extra first grade and the commercial first-grade licences qualify holders for employment at any ship or land station of any class.

109. *Commercial second grade.*—The applicant must pass a satisfactory examination in all the subjects prescribed above for the first grade, with the exception that the minimum speed in transmitting and receiving shall not be less than twelve words a minute in Continental Morse, and the examination in the subjects will not be as comprehensive as that given first-grade operators.

110. *Commercial cargo grade.*—Section 2 of the Act of July 23rd, 1912, provides: "On cargo steamers, in lieu of the second operator provided for in this Act, there may be substituted a member of the crew or other person who shall be duly certified and entered in the ship's log as competent to receive and understand distress calls or other usual calls indicating danger, and to aid in maintaining a constant wireless watch so far as required for the safety of life."

111. The examination will be conducted so as to determine the following facts:

(a) That the applicant is sufficiently familiar with the Continental Morse Code to recognise the distress signal (SOS), when included in a list of other words or signals sent slowly (approximately five words a minute).

(b) That the applicant is sufficiently familiar with the Continental Morse Code to recognise radio call letters of the vessel on which he desires to operate when sent slowly and repeated several times.

(c) That the applicant is sufficiently familiar with the type of the receiving apparatus of the vessel on which he desires to operate to determine by buzzer or similar test that the detector or receiving apparatus is properly adjusted to receive signals.

112. Examining officers and radio inspectors are authorised to issue a certificate, in the form of an amateur first-grade licence, after examination, to indicate the facts above enumerated in the case of a member of the crew or other person, and experience under this form will be credited by examining officers if the holder later applies for examination for a commercial licence. These licences will be marked "Cargo" in the upper right-hand corner under the serial number.

113. *Commercial temporary permit.*—Section 3 of the Act of August 13th, 1912, provides: "In case of emergency the Secretary of Commerce may authorise a collector of customs to issue a temporary permit, in lieu of a licence, to the operator on a vessel subject to the Radio Ship Act of June 24th, 1910."

114. The temporary permit, in the form of a letter to the operator, is to be issued only in cases of emergency and will be valid for one voyage from to beginning, unless the proper licence or properly licensed operator can be obtained en route.

115. The permits should be issued only to persons who the collector of customs has reason to believe are skilled in the use of the apparatus, but have not had the opportunity to present themselves for examination before Government officers authorised to conduct examinations and furnish licences.

116. The collector of customs will forward to the Department of Commerce (Bureau of Navigation) a report covering each temporary permit issued and the reasons for its issue.

117. *Experiment and instruction grade.*—Experimenters and instructors of scientific attainments in the art of radio communication whose knowledge of the radio laws satisfies the radio inspector or the examining officer may obtain this grade licence, provided they are able to transmit and receive in the Continental Morse Code at a speed sufficient to enable them to recognise distress calls or the "keep-out" signals.

118. The operator's licence for this grade is a commercial licence, endorsed by the Secretary of Commerce with a statement of the special purpose for which it is valid.

119. If the applicant qualifies, the radio inspector or examining officer will forward the papers to the Commissioner of Navigation, with his recommendation. If approved, the licence will be properly endorsed by the Secretary of Commerce and delivered to the licensee through the recommending officer.

120. This licence has no reference to the instruction of radio operators as such, but is required by those operating apparatus licensed as experimental stations but who are unable to obtain commercial grade operators' licences.

121. Amateurs before applying for licences should read and understand the essential parts of the International Radiotelegraphic Convention in force and sections 3, 4, 5, and 7 of the Act of August 13th, 1912. The Department recognises that radio communication offers a wholesome form of instructive recreation for amateurs. At the same time its use for this purpose must observe strictly the rights of others to the uninterrupted use of apparatus for important public and commercial purposes. The Department will not knowingly issue a licence to an amateur who does not recognise and will not obey this principle. To this end the intelligent reading of the International Convention and the Act of Congress is prescribed as the first step to be taken by amateurs. A copy of the radio laws and regulations may be procured for this purpose from the radio inspectors or from the Commissioner of Navigation, Department of Commerce, Washington, D.C., but they are not for public distribution. Additional copies may be purchased from the Superintendent of Documents, Government Printing Office, Washington, D.C., at a nominal price.

122. *Amateur first grade.*—The applicant must have a sufficient knowledge of the adjustment and operation of the apparatus which he wishes to operate and of the regulations of the International Convention and Acts of Congress in so far as they relate to interference with other radio communication and impose certain duties on all grades of operators. The applicant must be able to transmit and receive in Continental Morse at a speed sufficient to enable him to recognise distress calls or the official "keep-out" signals. A speed of at least ten words per minute (five letters to the word) must be attained.

123. *Amateur second grade.*—The require-

ments for the second grade will be the same as for the first grade. The second-grade licence will be issued only where an applicant cannot be personally examined or until he can be examined. An examining officer or radio inspector is authorised in his discretion to waive an actual examination of an applicant for an amateur licence, if the amateur for adequate reasons cannot present himself for examination but in writing can satisfy the examining officer or radio inspector that he is qualified to hold a licence and will conform to its obligations.

EXAMINATIONS.

124. The following requirements and method of conducting examination for radio operators' licences will be adopted at all examining offices.

125. The test shall consist of messages with call letters and regular preambles, conventional signals and abbreviations and odd phrases, and shall in no case consist of simple, connected reading matter. The test will be conducted by means of the omnigraph or other automatic instrument wherever possible.

126. The test shall continue for five minutes at a speed of twenty words, twelve words and ten words per minute, respectively, for the commercial first, second, and lower grades, and to qualify the applicant must receive twenty, twelve, or ten words in consecutive order.

127. The code test sheets written by the applicant will be forwarded to the Commissioner of Navigation with other papers and the speed attained noted in the lower left-hand corner of the first sheet.

128. An applicant will be given credit for the maximum speed he can attain.

129. The practical and theoretical examination shall consist of seven comprehensive questions under the following headings and values:

	Points, maximum value.
(a) Experience	20
(b) Diagram of receiving and transmitting apparatus	10
(c) Knowledge of transmitting apparatus	20
(d) Knowledge of receiving apparatus	20
(e) Knowledge of operation and care of storage batteries	10
(f) Knowledge of motors and generators	10
(g) Knowledge of international regulations governing radio communication and the United States radio laws and regulations	10
	100

130. Seventy-five constitutes a passing mark for the first-grade commercial. Sixty-five constitutes a passing mark for the second-grade commercial.

131. Applicants who fail to attain twenty words in the code test but who attain a mark of between sixty-five and seventy-five in the written examination may be issued second-grade licences, if they can receive at least twelve words per minute.

132. Question (a) shall determine the applicant's practical knowledge and experience in handling radio apparatus. An applicant's experience will be determined largely from the personal question sheet, and from satisfactory letters or references submitted. Expe-

rience, operating first-class amateur apparatus, or the apparatus provided in good training schools, will be given a reasonable value, but applicants who have had experience as apprentices at commercial shore stations or on board vessels will receive higher marks.

133. No applicant who fails to qualify will be re-examined at any examining office within three months from date of the previous examination. All examination papers, whether the applicant qualifies or not, will be forwarded to the Bureau of Navigation for filing as "Operator's record." When the records of the Bureau develop the fact that an applicant has failed to qualify and has applied for re-examination or been re-examined at the same or another office within three months, his existing licence may be suspended or revoked by the Secretary of Commerce. Applicants to whom are issued second-grade licences will not be examined for first-grade licences within three months under the same rule.

PLACES WHERE EXAMINATIONS ARE HELD.

134. (Excised.)

135. Naval radio stations: San Juan, P.R.; Colon, R.P.; Honolulu, H.T.

136. United States Army stations: Fort Omaha, Nebr.; Fort St. Michael, Alaska; Fort Valdez, Alaska.

137. Bureau of Navigation, Department of Commerce, Washington, D.C.

138. Radio inspectors, at their offices and elsewhere, by special arrangement.

139. Additional opportunities for taking the examination will be afforded as may be deemed necessary, and these special dates and places may be ascertained by communication with the Commissioner of Navigation, or nearest radio inspector.

140. All licences, when awarded, will be delivered through the officer who conducted the examination.

141. Examinations for the commercial extra first-grade licences will be held at the following offices only by appointment.

142. (Excised.)

143. United States radio inspectors, custom-houses: New Orleans, La.; San Francisco; Cal.; Seattle, Wash.; Chicago, Ill.; Boston, Mass.; New York, N.Y.; Baltimore, Md.; Detroit, Mich.

144. Commissioner of Navigation, Department of Commerce, Washington, D.C.

145. In special cases, upon application to the Commissioner of Navigation, arrangements may be made for examinations at other points.

APPLICATIONS FOR EXAMINATIONS FOR RADIO OPERATORS' LICENCES, RENEWALS, AND DUPLICATES.

146. An operator's licence may be granted to any person without regard to sex, nationality or age if the applicant can fulfil the requirements for the class of licence desired.

147. Applicants for licences should communicate in writing with the commandants, commanding officers, or officers in charge at navy yards, and army posts, with the Commissioner of Navigation, or radio inspectors, in order to fix the date when they can be examined. (See pars. 134-145.)

148. Commercial licences can only be obtained by personal examination. Where applicants are at remote points or cannot proceed to examining offices, efforts will be made to examine them through radio inspectors when

they are in that vicinity, but special trips cannot be made for that purpose.

149. Amateurs should write to the nearest examining officer in their vicinity (see pars. 134-145) for Form 756 (application for operator's licence) and to the radio inspector in their vicinity for Form 762 (application for licence for land station). If the application for operator's licence is also made to the radio inspector, both applications should be forwarded in the same envelope.

150. Amateur operators at points remote from examining officers and radio inspectors may be issued second-grade amateur licences without personal examination. Examinations for first-grade licences will be given by the radio inspector when he is in that vicinity, but special trips cannot be made for this purpose (see par. 123).

151. Persons holding radio operator's licences, amateur second grade, should make every effort to appear at one of the examination points to take the examination for amateur first-grade licence or higher.

152. Persons holding radio operator's licences of any grade should, before their licences expire, apply to the nearest radio inspector or examining officer for renewal and submit Form 756 in duplicate.

153. Radio operators of the commercial or cargo grades whose licences show on the service records satisfactory service for three months out of the last six months of the licence term may be issued new licences without re-examination. Other operators who submit satisfactory evidence to the examining officer, showing actual operations of radio apparatus for three months during the last six months of the licence term, may be issued new licences without re-examination. All others will be re-examined in the usual manner.

154. Whether or not a new licence is issued, the radio inspector or examining officer will forward one copy of Form 756, properly completed, to the Commissioner of Navigation, Department of Commerce. If a new licence is not issued, the reason therefor will be stated on the back of the form.

155. Any operator applying for a duplicate licence to replace an original which has been lost, mutilated, or destroyed will be required to submit an affidavit to the Bureau of Navigation through the radio inspector or examining officer who issued the original, attesting the facts regarding the manner in which the original was lost. The Commissioner of Navigation will consider the facts in the case and advise the radio inspector in regard to the issue of a duplicate licence. A duplicate licence will be issued under the same serial number as the original and will be marked "Duplicate" in red across the face.

156. Operators' licences are not valid until the oath for the preservation of the secrecy of messages is properly executed before a notary public or other officer duly authorised to administer oaths. Licences must indicate on their faces that the oath has been taken and the officer administering the oath on the back of the licence should sign also in the blank provided on the face.

157. Operators' licences should be framed and posted in the radio room, and licences for stations should be accessible at all times to inspectors.

158. Under the supervision of a licensed operator an apprentice or unlicensed person may learn the art by the actual use of the apparatus, but the licensed operator who fails

to enforce obedience to the regulations by the apprentice or unlicensed person serving under his supervision is liable to penalties as if he had himself violated the regulations.

159. An individual record is kept in the Bureau of Navigation, Department of Commerce, at Washington, of each licensed operator. Each operator's examination papers and all reports in regard to interference or violations of the radio laws and regulations are filed for reference.

160. Radio operators holding licences of any grade or class and applying for examination for any other grade or class must submit to the examining officer Form 756, in duplicate. If a new licence is issued the licence held by the applicant must be surrendered.

161. Radio operators who pass the examination for a higher grade licence are required to surrender their existing licences, which will be forwarded to the Commissioner of Navigation with the other papers.

162. Operators desiring to retain their expired or cancelled licences may make application therefor to the Commissioner of Navigation.

GENERAL INFORMATION.

ADMINISTRATION AND ADMINISTRATIVE DISTRICTS.

F 163. The Department has established, for the purpose of enforcing, through radio inspectors and others, the acts relating to radio communication and the International Convention, the following districts, with the principal office for each district at the custom house of the port named.

164. Communications for radio inspectors should be addressed as follows, and not to individuals: Radio Inspector, Customhouse, (city), (State).

165. Communications for the Bureau of Navigation should be addressed as follows, and not to individuals: Commissioner of Navigation, Department of Commerce, Washington, D.C.

166. (1) BOSTON, MASS.: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut.

(2) NEW YORK, N.Y.: New York (county of New York, Staten Island, Long Island, and counties on the Hudson River and including Schenectady, Albany, and Rensselaer) and New Jersey (Counties of Bergen, Passaic, Essex, Union, Middlesex, Monmouth, Hudson, and Ocean).

(3) BALTIMORE, MD.: New Jersey (all counties not included in second district), Pennsylvania (counties of Philadelphia, Delaware, all counties south of the Blue Mountains, and Franklin County), Delaware, Maryland, Virginia, District of Columbia.

(4) SAVANNAH, GA.: North Carolina, South Carolina, Georgia, Florida, Porto Rico.

(5) NEW ORLEANS, LA.: Alabama Mississippi, Louisiana, Texas, Tennessee, Arkansas, Oklahoma, New Mexico.

(6) SAN FRANCISCO, CAL.: California, Hawaii, Nevada, Utah, Arizona.

(7) SEATTLE, WASH.: Oregon, Washington, Alaska, Idaho, Montana, Wyoming.

(8) DETROIT, MICH.: New York (all counties not included in second district), Pennsylvania (all counties not included in third district), West Virginia, Ohio, Michigan (Lower Peninsula).

(9) CHICAGO, ILL.: Indiana, Illinois, Wisconsin, Michigan (Upper Peninsula), Minnesota,

Kentucky, Missouri, Kansas, Colorado, Iowa, Nebraska, South Dakota, North Dakota.

REPORTING OF VIOLATIONS.

167. The regulations established by law, or by the authority of law, or of the International Convention, will be enforced by the Secretary of Commerce through collectors of customs, radio inspectors, and other officers of the Government.

168. The service regulations of the radio-telegraphic Convention in force provide that "no station on shipboard shall be established or worked by private enterprise without authority from the Government to which the vessel is subject." Such authority shall be in the nature of a licence issued by said Government. Stations on foreign ships will be licensed by their Governments respectively. Inspectors will report to the Commissioner of Navigation stations on foreign ships not so licensed.

169. A radio inspector is authorised in exceptional cases to act outside of his district for the convenience of commerce. In such cases he will communicate before or after acting with the inspector in whose district he has acted. Radio inspectors are authorised to communicate directly with collectors of customs and to co-operate with them in the enforcement of the law.

170. Violations of the laws and regulations will be reported to the chief customs officer of the district in which the offence occurs, who will report the case to the Secretary of Commerce (Bureau of Navigation), according to the procedure followed in violations of the navigation laws. Misdemeanours will be reported to the United States district attorney in the usual manner.

171. Collectors of customs and radio inspectors are enjoined that the reports required by paragraph 170 must be precise statements of the facts as the basis for possible proceedings by the United States attorney.

172. Violations by the master of a vessel of the United States of the provisions of the second paragraph of section 1 of the ship act will be reported to the collector of customs directly, and the usual procedure in cases of fines and penalties will be followed.

INSPECTION OF SHIP STATIONS.

173. The radio inspectors and customs officers, as far as practicable shall visit steamers subject to the act before they leave port and ascertain if they are equipped with the apparatus in charge of the operators prescribed by law and regulation.

174. When the radio apparatus is certified as complying with the requirements of law by the competent authorities of a foreign Government, such certificate will be recognised by this Department, but the radio inspector or customs officer may, if he deem it necessary or desirable, satisfy himself that the apparatus is in good working order.

175. Whenever practicable the radio inspector shall satisfy himself on his visit before the departure of a steamer subject to the act of July 23rd, 1912, that the apparatus is efficient and in good working order within the meaning of the Act, and if satisfied he shall issue a certificate in the form of Appendix A (form 752). The duplicate of these certificates will be filed with the collector of customs as a record of the radio equipment on vessels sailing from his port.

176. These certificates will be issued only if the inspection is made within two hours of sailing time.

177. For each clearance the master of a steamer coming under the Act of July 23rd, 1912, is required to furnish to the customs officer a certificate in the form in Appendix B (Form 753). Such certificate shall be retained in the files of the collector of customs. Whenever the radio inspector is absent from his home port he will notify the collector of customs, who will arrange for the collection of certificates and survey of equipment.

178. Where a steamer subject to the radio law is without the apparatus and the operators prescribed, or either of them, and is about to attempt to leave port, the radio inspector or customs officer visiting the vessel shall:

(a) Furnish the master with a memorandum (stub of Form 771) of the particulars in respect of which the law has not been complied with and the penalty;

(b) if convenient, notify the vessel's agents or the proper person in charge of the apparatus so that the necessary corrections may be made before sailing.

179. If a steamer clears in violation of the law the radio inspector or customs officer shall submit to the collector of customs of the port a written report, stating the exact nature of the violation, the section of the law violated, and the penalties involved and all of the circumstances in connection therewith which will be of service to the collector and to the Secretary of Commerce in determining what action shall be taken. A copy of the report will be forwarded to the Commissioner of Navigation.

180. Statements should be obtained from operators, ships officers, or other witnesses at the time the violation is discovered and should accompany the report to the collector of customs.

181. The collector of customs will report the case to the Secretary of Commerce in the usual manner as a navigation fine case.

182. Merchant vessels chartered by the United States Government are subject to the Act of August 13th, 1912, in every case, if the radio apparatus is owned and operated by a commercial company.

183. Merchant vessels chartered by the United States Government for the transportation of persons or supplies are subject to the requirements of the ship act (Act of July 23rd, 1912), if the vessel is controlled and operated by the owners. Vessels commanded wholly or in part by Government officers are not subject to the ship act.

184. Government vessels or vessels chartered by the Government are subject to the act of August 13th, 1912, if the radio equipment is owned and operated by private interests.

185. The ship act does not authorise the refusal of clearance in case of violation of its provisions, but specifically provides for the imposition of a fine in a sum not more than \$5,000.

186. The act does not apply to a vessel at the time of entering a port of the United States. Radio inspectors and customs officers may, however, accept as evidence of the efficiency of the operators and the skill of an operator messages shown to have been transmitted and received by him over a distance of at least 100 miles, by day, during the voyage to the United States.

OPERATORS ON FOREIGN VESSELS.

187. In so far as licensed operators are concerned a sharp distinction should be drawn

between the Act of July 23rd, 1912, which requires apparatus and operators for radio communication on steamers and the Act of August 13th, 1912, to regulate radio communication.

188. The Act of July 23rd, 1912, amending the Act of June 24th 1910, is designed to promote safety at sea through the employment of apparatus and operators to transmit and receive distress calls and other calls relating to perils and aids to navigation. It provides that in the case of American and foreign vessels subject to its provisions "the radio equipment must be in charge of two or more persons skilled in the use of such apparatus." This Act does not require that the operators shall be licensed, and the penalty prescribed in section 3 of the Act is not incurred by the master of a vessel whose operators are "skilled in the use of such apparatus," even though they may not be licensed.

189. The Act of August 13th, 1912, is designed to execute in behalf of the United States the International Radiotelegraphic Convention and thus to promote orderly exchanges by radio communication. For this purpose the International Radiotelegraphic Convention (Service Regulations) provides that the service of the station on shipboard shall be carried on by a telegraph operator holding a certificate issued by the Government to which the vessel is subject.

190. Section 3 of the Act of August 13th, 1912, carries out this provision of the International Convention by providing licences for operators on American vessels. If an unlicensed person serves in charge or in supervision of the use and operation of the apparatus both he and his employer are liable to a fine of not more than \$100 or imprisonment for not more than two months or both. This section and penalty do not apply to operators on foreign ships. But operators on the ships of foreign nations signatory to the International Radiotelegraphic Convention, as shown above, are required to have certificates or licences from their own governments, and if not so certificated, the obligations of the convention have not been observed. The convention in the Service Regulations provides for this situation.

191. The Act of July 23rd, 1912, as stated, requires that on American and foreign ships the operators must be "skilled in the use of such apparatus," but does not require that they must be licensed. To facilitate commerce and simplify administration, operators presenting American licences or foreign certificates are accepted as "skilled in the use of such apparatus," except where there may be special reasons to doubt the operator's skill or reliability. Where operators on American or foreign ships do not have such licences or foreign certificates, radio inspectors or customs officers under the Act of July 23rd, 1912, may accept other competent evidence of skill or may examine such operators.

OFFICIAL INTERNATIONAL LIST OR COAST AND SHIP RADIO STATIONS OF THE WORLD AND STATION RATES.

192. The list of land and ship stations of the United States including amateurs, giving call letters, wavelengths, nature of service, etc., can be procured from the Superintendent of Documents, Government Printing Office, Washington, D.C., at a nominal price.

193. Supplements to this list are issued quarterly and the list is revised annually, as of July 1st. Information concerning amateur stations will not be included in the supplements, but in the annual edition only.

194. The introduction to the list of "Radio Stations of the United States" contains information concerning the assignment of international and amateur call letters.

195. A copy of the Official Berne List, and supplements as issued, are required as a part of the equipment of every station open to general public service.

196. The International List of Radio Stations of the World (edition in English) can be procured from the International Bureau of the Telegraphic Union (Radiotelegraphic Service), Berne, Switzerland.

197. In addition to the information contained in the pamphlet of the United States stations, published by the Bureau of Navigation, the international list shows geographical locations, normal ranges in nautical miles, radio systems and rates.

198. The international list includes the Government and commercial land and ship stations of the United States. The list is divided into three parts. The first part contains a list of ship stations, grouped by countries and arranged alphabetically; the second part contains a list of land stations arranged in the same manner; and the third part contains tables of land line and cable charges from coast radio stations to inland and various other points. In computing the total word rate applicable to a radiogram from a ship station to an inland point or *vice versa*, the three rates must be added. The rates in the international list are stated in francs. For approximate purposes 1 franc equals 20 cents and 5 centimes equals 1 cent. Supplements to the international list will be issued monthly, and will contain new stations and tables of alterations.

199. The International Alphabetical List of Call Letters (stations of the world) is also issued by the international bureau at Berne, and supplements will be issued monthly.

200. Neither the international list proper nor the supplements will contain a list of amateur stations.

201. Inquiries as to the subscription price of these lists should be made direct to the Berne bureau, at the address given above. (See par. 196.) Remittances to Berne should be made by international postal money order.

MISCELLANEOUS INFORMATION.

202. Stations equipped to receive only do not require licences.

203. Operators of receiving stations do not require licences, but *all persons* are required to maintain secrecy in regard to messages, as provided in the Act of August 13th, 1912, nineteenth regulation of section 4.

204. Distances under the radio laws are computed in nautical miles.

205. No fees are charged for any operator or station licence.

206. Licensed stations must be operated by or under the direct supervision of properly licensed operators.

207. Amateur stations within five miles of naval or military stations need not have been in actual operation on or before August 13th, 1912, to obtain a licence for a restricted amateur station.

208. The master of a vessel shall have the

right to censor all messages addressed to or transmitted by a radio telegraph station on board his vessel, but such master shall not divulge to any person (other than the properly authorised officials of the Government, or a competent legal tribunal) or make any use whatever of any message coming to his knowledge through the exercise of such censorship, nor shall the master or any operator divulge to any person (other than the properly authorised officials of the Government, or a competent legal tribunal) or make any use whatever of any message (other than a message of distress) coming to his knowledge and not intended for the said station.

209. The transmission of superfluous signals by any ship or coast station is absolutely prohibited; trials and practices are forbidden except under such circumstances as to preclude the possibility of interference with other stations.

210. No person shall transmit or make a signal containing profane or obscene words or language.

211. Additional or amendatory regulations will be issued from time to time as they may appear necessary.

Radio Service Form 752.

CERTIFICATE OF RADIO INSPECTION.

PART OF

G This is to certify that I have to-day examined the apparatus for radio communication on the s.s. _____, of which _____ is master, about to leave this port for _____, and I have found the same efficient and in good working order, as prescribed by the Act of June 24th, 1910, as amended by the Act of July 23rd, 1912.

K Pursuant to the Act to regulate radio
communication, approved August 13th,
1912, , a citizen of the

State of

.....
a company incorporated under the laws of the
State of having
applied therefor, is hereby granted by the
Secretary of Commerce for a period of
on and subject to the restrictions and con-
ditions hereinafter stated and revocable for
cause by him, this licence to use or operate
the apparatus for radio communication
(identified in the schedule hereinafter) located
in the State of city
or town of for the purpose
of transmitting to and receiving from ship
stations and other land stations general public
correspondence, Government and service
correspondence, and distress signals and
messages, at rates of compensation not in
excess of those fixed by the international
agreement to which the Government of the
United States has adhered, which have been
submitted to and approved by the Secretary
of Commerce, as included in the schedule
hereinafter.

2. The use or operation of apparatus for
radio communication pursuant to this licence
shall be subject also to the articles and regu-
lations established by the International
Radiotelegraphic Convention, ratified by the
Senate of the United States and caused to be
made public by the President "to the end that
the same and every article and clause thereof
may be observed and fulfilled with good faith
by the United States and the citizens thereof,
and shall be subject also to such regulations
as may be established from time to time by
authority of subsequent acts and treaties of
the United States.

3. The authority conferred by this licence
is subject to the provisions of the Act of February
4th, 1887, entitled "An Act to regulate
commerce," as amended by the Act of June
18th, 1910, so far as the licensee may be within
the operation of said Act, and except as pro-
vided in the Act of August 13th, 1912, or in
the International Radiotelegraphic Con-
vention and regulations made part thereof,
the station shall transmit all messages offered
by those who tender lawful rates on equal
terms without discrimination, whether as
regards rates, order of transmission, or other-
wise.

4. The licensee shall render to the Secretary
of Commerce such accounts as the Secretary
of Commerce shall direct in respect of all
charges due or payable under the International
Radiotelegraphic Convention in respect of
messages exchanged between the station hereby
licensed and other stations and shall pay to
the Secretary of Commerce, at such times and
in such manner as the Secretary of Commerce
shall direct, all sums which shall be due from
the licensee under such accounts.

5. The apparatus shall at all times while in
use and operation be in charge or under the

supervision of a person or persons licensed
for that purpose by the Secretary of Commerce,
and the operator of the apparatus shall not
wilfully or maliciously interfere with any other
radio communication.

6. The station shall give absolute priority
to signals and radiograms relating to ships
in distress; shall cease all sending on hearing
a distress signal; and, except when engaged in
answering or aiding the ship in distress,
shall refrain from sending until all signals
and radiograms relating thereto are completed.

7. The station during the hours of operation
shall listen-in at intervals of not less than 15
minutes and for a period of not less than two
minutes with the receiver tuned to receive
messages of 300 metres wavelength.

8. The station shall use the minimum amount
of energy necessary to carry out any com-
munication desired, except in case of signals
or radiograms relating to vessels in distress.

9. The station shall exchange radiograms
with any other commercial station and with
any ship station without distinction of the
radio systems adopted by such stations.

10. The station shall not use a transmitter
during the first 15 minutes of each hour, local
standard time, except for distress signals,
whenever the Secretary of Commerce by notice
in writing shall require it to observe a division
of time, pursuant to the Twelfth Regulation
by the Act of August 13th, 1912.

11. The President of the United States in
time of war or public peril or disaster is author-
ised by law to close the station and cause the
removal therefrom of all radio apparatus or
may authorise the use or control of the
station or apparatus by any department of the
Government upon just compensation to the
owners.

12. The Secretary of Commerce and Col-
lectors of Customs or other officers of the
Government authorised by him may at all
reasonable times enter upon the station for
the purpose of inspecting and may inspect
any apparatus for radio communication of
such station and the operation and operators
of such apparatus.

13. The apparatus shall not be altered or
modified in respect of any of the particulars
mentioned in the following schedule, except
with the approval of the Secretary of Com-
merce.

SCHEDULE OF STATION AND APPARATUS.

 RADIO SERVICE.

L Pursuant to the Act to regulate radio communication, approved August 13th, 1912 a citizen of the State of

For long-range public service and for any service other than general public correspondence the station is authorised to use the following additional wavelengths under 600 or over 1,600 metres :

Metres, ; Metres, ; Metres, ;
 Metres, ; Metres, ;

The energy, if radiated by the transmitter in two or more wavelengths as indicated by a sensitive wavemeter, shall not in any one of the lesser waves exceed 10 per cent. of that in the greatest; and the logarithmic decrement per complete oscillation in the wave trains shall not exceed two-tenths, except when sending signals or messages relating to vessels in distress.

..... a company incorporated under the laws of the State of having applied therefor, is hereby granted by the Secretary of Commerce for a period of on and subject to the restrictions and conditions hereinafter stated and revocable for cause by him, this licence to use or operate the apparatus for radio communication

(identified in the schedule hereinafter) on the called
(Type of vessel.)
....., a vessel of the
(Name of vessel.)

United States, official number , for the purpose of transmitting to and receiving from other ship stations and land stations general public correspondence, Government and service correspondence, and distress signals and messages, at rates of compensation not in excess of those fixed by the International Agreement to which the Government of the United States has adhered, which have been submitted to and approved by the Secretary of Commerce, as included in the schedule hereinafter.

2. The use or operation of apparatus for radio communication pursuant to this licence shall be subject also to the articles and regulations established by the International Radiotelegraphic Convention, ratified by the Senate of the United States and caused to be made public by the President "to the end that the same and every article and clause thereof may be observed and fulfilled with good faith by the United States and citizens thereof," and shall be subject also to such regulations as may be established from time to time by authority of subsequent acts and treaties of the United States.

3. The authority conferred by this licence is subject to the provisions of the act of February 4th, 1887, entitled "An Act to Regulate Commerce," as amended by the Act of June 18th, 1910, so far as the licensee may be within the operation of said Act, and except as provided in the Act of August 13th, 1912, or in the International Radiotelegraphic Convention and regulations made part thereof, the station shall transmit all messages offered by those who tender lawful rates on equal terms without discrimination, whether as regards rates, order of transmission, or otherwise.

4. The licensee shall render to the Secretary of Commerce such accounts as the Secretary of Commerce shall direct in respect of all charges due or payable under the International Radiotelegraphic Convention in respect of messages exchanged between the station hereby licensed and other stations, and shall pay to the Secretary of Commerce, at such times and in such manner as the Secretary of Commerce shall direct, all sums which shall be due from the licensee under such accounts.

5. The apparatus shall at all times while in use and operation be in charge or under the supervision of a person or persons licensed for that purpose by the Secretary of Commerce, except when in case of emergency the Collector of Customs by authority of the Secretary of Commerce shall issue a temporary permit, in lieu of a licence, to the operator. The operator of the apparatus shall not wilfully or maliciously interfere with any other radio communication.

6. The station shall give absolute priority to signals and radiograms relating to ships in distress; shall cease all sending on hearing a distress signal; and, except when engaged in answering or aiding the ship in distress shall refrain from sending until all signals and radiograms relating thereto are completed.

7. The station shall be prepared to send the international signal of distress and distress signals on the normal wavelength designated by the International Radiotelegraphic Convention in force with sufficient power to enable them to be received by day over sea

a distance of 100 nautical miles by a ship station equipped with apparatus for sending and receiving equal in all essential particulars to the apparatus of the station herein licensed.

8. The station shall use the minimum amount of energy necessary to carry out any communication desired, except in case of signals or radiograms relating to vessels in distress.

9. The station shall exchange radiograms with any other ship station without distinction of the radio systems adopted by such stations.

10. The station shall not use, except for sending signals of distress or signals and radiograms relating thereto, or when, owing to unusual circumstances, communication can be established only by means of an increase of power, a transformer input exceeding 1 kw., or exceeding $\frac{1}{2}$ kw. when within five nautical miles of a naval or military station.

11. The President of the United States in time of war or public peril or disaster is authorised by law to close the station and cause the removal therefrom of all radio apparatus, or may authorise the use or control of the station or apparatus by any department of the Government upon just compensation to the owners.

12. The Secretary of Commerce and Collectors of Customs or other officers of the Government authorised by him may at all reasonable times enter upon the station for the purpose of inspecting, and may inspect any apparatus for radio communication of such station and the operation and operators of such apparatus.

13. The apparatus shall not be altered or modified in respect of any of the particulars mentioned in the following schedule, except with the approval of the Secretary of Commerce.

LICENCE FOR LAND RADIO STATION.
Class

DEPARTMENT OF COMMERCE.
BUREAU OF NAVIGATION.
RADIO SERVICE.

M Pursuant to the Act to regulate radio communication, approved August 13th, 1912,
a citizen of the State of .., a company incorporated under the laws of the State of .., having applied therefor, is hereby granted by the Secretary of Commerce for a period of .. on and subject to the restrictions and conditions hereinafter stated and revocable for cause by him, this licence to use or operate the apparatus for radio communication (identified in the schedule hereinafter) for the purpose of transmitting to and receiving from ship stations and other land stations public correspondence, Government and service correspondence, and distress signals and messages at rates of compensation not in excess of those fixed by the international agreement to which the Government of the United States has adhered, which have been submitted to and approved by the Secretary of Commerce, as included in the schedule hereinafter, or for the purpose of conducting experiments for the development of the science of radio communication or the apparatus pertaining thereto, to carry on special tests, using any amount of power or any wavelengths, at such hours and under such conditions as will insure the least interference with the sending or receipt of commercial or Government radiograms, of distress signals and radiograms, or with the work of other stations, the purpose of the station being designated by the classification at the head of this licence.

2. Public correspondence or limited commercial correspondence authorised by this licence shall be limited to certain stations, ships or lines of ships named hereinafter, which designation is authorised in view of the nature of the service and is independent of the radio system employed.

3. The use or operation of apparatus for radio communication pursuant to this licence shall be subject also to the articles and regulations established by the International Radiotelegraphic Convention, ratified by the Senate of the United States and caused to be made public by the President, and shall be subject also to such regulations as may be established from time to time by authority of subsequent Acts and treaties of the United States, in so far as they apply to the class of station indicated by this licence.

4. The authority conferred by this licence is subject to the provisions of the Act of February 4th, 1887, entitled "An Act to Regulate Commerce," as amended by the Act of June 18th, 1910, so far as the licensee may be within the operation of said Act, and except as provided in the Act of August 13th, 1912, or in the International Radiotelegraphic Convention and regulations made part thereof, the station shall transmit all messages offered by those who tender lawful rates on equal terms without discrimination, whether as regards rates, order of transmission, or otherwise.

5. The licensee shall render to the Secretary of Commerce such accounts as the Secretary of Commerce shall direct in respect of all charges due or payable under the International Radiotelegraphic Convention in respect of messages exchanged between the station hereby licensed and other stations, and shall pay to the Secretary of Commerce, at such times and in such manner as the Secretary of Commerce shall direct, all sums which shall be due from the licensee under such accounts.

6. The apparatus shall at all times while in use and operation be in charge or under the supervision of a person or persons licensed for that purpose by the Secretary of Commerce, and the operator of the apparatus shall not wilfully or maliciously interfere with any other radio communication.

7. The station shall give absolute priority to signals and radiograms relating to ships in distress; shall cease all sending on hearing a distress signal; and, except when engaged in answering or aiding the ship in distress, shall refrain from sending until all signals and radiograms relating thereto are completed.

8. The station shall use the minimum amount of energy necessary to carry out any communication desired, except in case of signals or radiograms relating to vessels in distress.

9. The station shall not use a transmitter during the first fifteen minutes of each hour, local standard time, except for distress signals, whenever the Secretary of Commerce by notice in writing shall require it to observe a division of time, pursuant to the Regulation 12 of the Act of August 13th, 1912.

10. The President of the United States in time of war or public peril or disaster is authorised by law to close the station and cause the removal therefrom of all radio apparatus, or may authorise the use or control of the station or apparatus by any department of the Government upon just compensation to the owners.

11. The Secretary of Commerce and Collectors of Customs or other officers of the Government authorised by him may at all reasonable times enter upon the station for the purpose of inspecting and may inspect any apparatus for radio communication of such station and the operation and operators of such apparatus.

Operators must have the service record on the backs of their licences properly completed and signed by the master of their ship or their employer.

NOTICE TO BERNE BUREAU.

S The Minister of Marine of the United States of America has notified to the Berne Bureau that the following information is to be published:—

1. The Departments of the United States Government which are concerned with wireless telegraphy regret that they have not yet been able to make arrangements with the land telegraph of the United States owing to the fact that these are in the hands of commercial companies, and have nothing to do with the Government. The idea was to arrange for the free transmission over the land telegraph, in accordance with Article 14, paragraph 2, of the Rules of Service of the London Convention. The information to be transmitted free of charge was all such as related to the date and the hour of the handing in of radio-telegrams on board ship. But the transmission of such information over land lines being subject to a tax, the Government of the United States cannot, at present, conform strictly to

..... Oath of Secrecy executed :

This is to certify that the holder of this licence has served satisfactorily as radio operator under my orders during the period named.

this rule of the Convention. The declaration of the American delegation contained in Article 2 of the Final Protocol made provision for such a possible outcome, although its exact nature was not actually set forth.

2. Multiple radiotelegrams, such as are mentioned in article 38, paragraph 5, of the Rules of Service, will be accepted as multiple messages in all wireless transmission between ship and shore stations, but all the companies operating land telegraph lines in the United States will consider, and will charge for, a multiple wireless message as consisting of so many individual telegrams as the addresses it bears may indicate.

3. The United States is not a member of the International Telegraphic Union and consequently is not bound to execute the rules laid down in Article 38, paragraph 8, of the London Convention Rules of Service concerning urgent radiotelegrams. The laws of the United States regulating all reciprocal arrangements between the States forbid the use of the privilege, and consequently all telegraph companies will not allow any priority in favour of telegrams for which any additional tax may have been paid.

T An Act to authorise the President of the United States to arrange and participate in an international conference to consider questions relating to international communication.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the President of the United States be, and he is hereby, requested and authorised in the name of the Government of the United States to call, in his discretion, an international conference to assemble in Washington, and to appoint, by and with the advice and consent of the Senate, representatives to participate therein, to consider all international aspects of communication by telegraph, telephone, cable, wireless telephone, and wireless telegraphy, and to make recommendations with a view to providing the entire world with adequate facilities for international communication on a fair and equitable basis.

SEC. 2.—That the sum of \$75,000, or so much thereof as may be necessary, is hereby

appropriated out of any money in the Treasury not otherwise appropriated, the same to be disbursed under the direction and in the discretion of the Secretary of State for expenses incidental to the conference, including personal services in the District of Columbia notwithstanding the provisions of any other Act: Provided, That no part of said sum shall be used in entertainment or for the purchase of medals and badges.

Approved, December 17th, 1919.

U. S. RADIO COMPASS STATIONS.

U Masters of vessels are invited to make use of the U.S. naval radio compass (direction finding) stations to fix positions. They will be found especially useful during thick weather.

The following U.S. naval shore radio compass stations are now in operation for the purpose of furnishing bearings in the Western Atlantic and the Gulf of Mexico. For the present there will be no charge for bearings furnished.

U. S. ATLANTIC AND GULF COASTS.

Radio Compass Station.	Radio Call.	Position.

*Limited Service.

NOTE.—The following radio compass station is temporarily out of commission:—Cape Cod, Mass.

U. S. PACIFIC COAST.

The following stations on the Pacific Coast

at San Francisco Harbour entrance are completed and will be placed in commission on or about September 15th, 1920, to give continuous service to shipping:—

Radio Compass Station.	Radio Call.	Position.	
Point Reyes, Calif.	NLG	Lat. 38° 02' 31" N.	Lon. 122° 59' 30" W.
Bird Island, Calif.	NLD	Lat. 37° 49' 24" N.	Lon. 122° 32' 14" W.
Point Montara, Calif.	NLH	Lat. 37° 32' 04" N.	Lon. 122° 31' 06" W.
Farallon Island, Calif.	NPI	Lat. 37° 42' 00" N.	Lon. 123° 00' 00" W.

These four stations will be under the control of Farallon Island radio, but for the present will continue to handle bearings independently as well as a co-ordinated group. Masters of ships are informed that in making use of the San Francisco Harbour entrance group they are requested to call the Farallon Island Station, who will obtain bearings from the remaining

stations in the group and furnish them to the ship, after corrections have been applied.

Where two or more of the foregoing compass stations have the same radio call it indicates that they are connected by wire telegraph to and under the control of a central control station, the radio call being the call of the central control station. When a request for bearings

is made the central control station invariably answers with a bearing from each of the compass stations under its control.

The following signals have been authorised and will be used until further notice:—

SIGNAL.	MEANING.
QTE ?.....	What is my true bearing ?
QTEYour true bearing is....degrees	
from.....Radio Compass	
Station.	

To obtain bearings the compass station should be called in the usual manner, using the 800-meter wavelength, the call to be followed by the signal "QTE?," meaning "What is my true bearing?" When told by the compass station to "K" (go ahead) the ship's radio operator should follow the procedure outlined below:—

(a) Transmit the ship's radio call for 30 seconds.

(b) Make dashes, each dash five seconds long, for one minute, with the ship's radio call after each dash.

(c) Terminate with the signal "K" (go ahead).

If satisfactory bearings are obtained the operator at the compass station will call the vessel in the usual manner and reply "QTE," followed by the true bearing in degrees (0 to 359) spelled out in words, and the name of the radio compass station from which the bearing was obtained; otherwise a repetition of the test will be requested.

The ship's operator should acknowledge receipt of the bearings by answering the compass station in the usual manner and repeat, in numerals, the bearings received. This procedure enables all stations concerned to check the bearings.

All U.S. naval shore radio compass stations keep watch and transmit on 800 metres for merchant vessels, and this wavelength must be used for calling and answering and carrying on all communications with these stations.

Attention is invited to the fact that when a single bearing is furnished there is a possibility of an error of 180 degrees, as the operator at the compass station cannot always determine on which side of his station the vessel lies; in such cases the decision is left to the commander of the vessel.

Subject to the foregoing, bearings should be accurate within 2 degrees of an arc. When bearings from three or more compass stations are not over 2 degrees of arc in error, but do not meet at a fixed point, the geometrical centre of the triangle formed by the bearings can generally be taken as the approximate position of the vessel.

The primary object of these stations is to assist in the navigation of vessels during atmosphere of low visibility.

In order that the operation of shore radio compass stations may be checked up, it is requested that a brief report be forwarded to the Director, Naval Communications, Navy Department, Washington, D.C., containing the following particulars:—

1. Name of ship;
2. Name of radio compass station;
3. Date of G.M.T. at which radio bearing was taken;
4. Bearing given by radio compass station;
5. Estimated position of ship at above time and dates by methods other than radio;
6. The probable degree of accuracy of the estimated position;

7. Weather conditions at above time;
8. Remarks, if any;
9. Signature of master or responsible navigating officer.

ACCURACY OF RADIO BEARINGS.

The following information was furnished by the Director of the U.S. Naval Communication Service under date of October 10th, 1919:—

"The reliance that can be placed in bearings furnished by shore radio compass stations will be governed by the following conditions:—

- (a) When two sets of bearings are received which do not agree, a third set should immediately be requested.
- (b) In thick weather, bearings should be requested at least every half-hour.
- (c) Bearings that pass over intervening land or that are tangent to the shore line are not as reliable as those that have a clear sweep over the sea.
- (d) Navigators receiving a set of bearings should immediately investigate the approximate fix indicated and determine whether or not they are being furnished with bearings from the stations that should be most reliable.
- (e) When the position of the ship as indicated by the radio bearing differs materially from the position of dead reckoning, a second set of radio bearings should be requested in order to check the first radio position."

NOTE.—While the Navy Department states that at the present time radio compass bearings have reached a high degree of accuracy, it must be understood that the Government incurs no liability for any consequences resulting from any inaccuracy in the taking or transmission of radio compass bearings. These bearings are provided free of charge, as aids to navigation, to be used at the discretion of the master of the vessel.

PUBLIC RESOLUTION:

No. 48—66TH CONGRESS.

V Joint Resolution to authorise the operation of Government-owned Radio Stations for the use of the general public, and for other purposes.

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled: That all land, ship and airship radio stations, and all apparatus therein owned by the United States may be used by it for receiving and transmitting messages relating to Government business, compass reports and the safety of ships.

SEC. 2. That the Secretary of the Navy is hereby authorised, under terms and conditions and at rates prescribed by him, which rates shall be just and reasonable, and which, upon complaint, shall be subject to review and revision by the Interstate Commerce Commission, to use all radio stations and apparatus, wherever located, owned by the United States and under the control of the Navy Department—(a) for the reception and transmission of press messages offered by any newspaper published in the United States, its territories or possessions, or published by citizens of the United States in foreign countries, or by any press association of the United States, and (b) for the reception and transmission of private commercial messages. Provided: That the rates fixed for the reception

and transmission of commercial messages, other than press messages, shall not be less than the rates charged by privately-owned and operated stations for like messages and service: Provided further, That the right to use such stations for any of the purposes named in this section shall terminate and cease as between any countries or localities or between any locality and privately operated ships, whenever privately owned and operated stations are capable of meeting the normal communication requirements between such countries or localities or between any locality and privately operated ships, and the

Secretary of Commerce shall have notified the Secretary of the Navy thereof, and all rights conferred by this section shall terminate and cease in any event two years from the date this resolution takes effect.

SEC. 3. That all stations owned and operated by the Government, except as herein otherwise provided, shall be used and operated in accordance with the provisions of the Act of Congress entitled "An Act to regulate radio communication," approved August 13th, 1912.

Approved, June 5th, 1920.

URUGUAY

THE independence of the Republic of Uruguay, originally part of the Spanish Viceroyalty of Rio de la Plata, and later on a Province of Brazil, was declared on August 25th, 1825, and recognised by Treaty on August 27th, 1828. The constitution was sworn on July 18th, 1830. Legislation is administered by a Parliament of two Houses, the Executive being in the hands of a President elected every four years. The total area of the nineteen departments into which the country is divided is estimated at 72,153 square miles. The capital city is Montevideo, situated on the northern bank of the River Plate Estuary.

CONTROL.

Wireless telegraphy in Uruguay is controlled by the Government, the department in charge being the Ministry of War and Marine. The Government ship stations are also under the control of the Minister of War and Marine. There are no privately owned stations. There are no radiotelegraphic clubs or societies, in fact wireless telegraphy is entirely a Government monopoly.

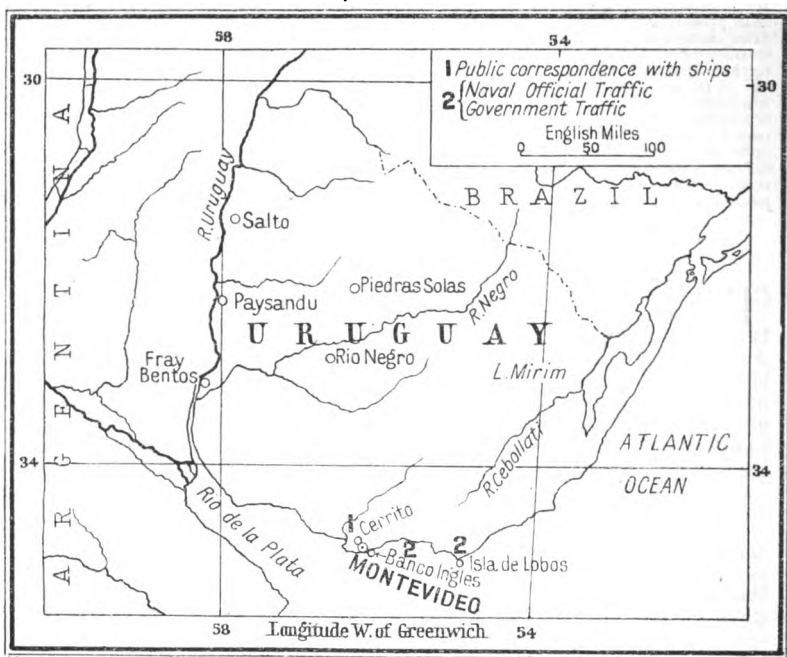

ORGANISATION.

The installation of wireless telegraphy in Uruguay was authorised by a Government Decree dated June 22nd, 1910. This Decree provided for one long-distance station at Montevideo, minimum range 500 miles; two situated respectively at Paso de los Toros and Rivera (Northern Frontier), with minimum range of 372 miles; two respectively situated at Lobos Island and the English Bank, each with minimum range of five miles; besides installations on the various Government vessels. By the end of the year 1911 the service (supplemented by two Military Field Stations) was in working order.

The Montevideo station, opened to the public in December, 1911, and standing on a hill three miles from the river, is the only installation doing international work. Its location is called Cerrito de la Victoria, and the wireless station generally goes by the name of "Cerrito." The installations situated at Rivera and Paso de los Toros are employed solely for military purposes, and only in times of crisis, should a breakdown of the ordinary wired service eventuate, are they used for public messages.

ADMINISTRATION.

The first Decree regulating the subject was issued by the Ministry of War and Marine on September 5th, 1911, and was followed by a decree dated January, 1912. Under its provisions *all ships calling at the ports of the Republic and destined for passenger service are obliged to be fitted with wireless apparatus.*

We print here the text of both the Decrees above referred to:—

A—Decree of September 5th, 1911.

B—Decree of January, 1912.

DECREE OF SEPTEMBER 5TH, 1911.

A 1. The National Wireless Telegraphy Office is under the direct control of the Ministry of War and Marine, with the Engineer Inspector-General as its head.

2. The National Wireless Telegraph Office is in charge of and controls all the radiotelegraphic stations, whether fixed or military movable ones, on vessels or on lighthouses, together with their staff, apparatus and installations.

3. The Inspector-General will at such times and under such circumstances as he thinks proper make visits of inspection of the stations in order to take personal cognisance of their requirements, and he exercises in regard to the staff, whether military or civil, the character of a staff commander.

4. On the occasions of manoeuvres the Inspector-General will designate the country stations which are to take part in accordance

with the instructions he receives as to the requirements of the occasion.

5. It is one of the duties of the National Wireless Telegraph Office to propose to the superior department the construction of fresh stations and to report regarding the means for acquiring the same.

6. The Inspector-General controls the sums received for transmission of telegrams, which sums shall be deposited in the Bank of the Republic to the order of the Minister of War and Marine.

7. The National Wireless Telegraph Office will make contracts with the General Post and Telegraph Office and with the shipping companies to be submitted for approval to the Minister of War and Marine; similarly the office is empowered to draw up with the administrations of the neighbouring States radiotelegraphic agreements with the object of improving and amplifying the international wireless telegraph service, all of which shall be

submitted for approval by the higher department.

8. The Minister of War and Marine will notify the International Office in Berne of the creation of the National Wireless Telegraph Office in Uruguay, so that in future all questions concerning wireless telegraphy in Uruguay may be referred direct to it.

9. The Inspector-General will report quarterly to the Minister of War and Marine regarding the general conditions and working of the service under his charge, and will compile an annual memorandum upon the general work of his department.

DECREE OF JANUARY, 1912.

B 1. Commencing from May 1st of the present year (1912) all the ships carrying passengers between the harbours of the Republic and those of foreign countries shall be fitted with radiotelegraph installations.

2. The said installations shall be designed to receive and transmit telegrams up to a distance of not less than one hundred kilometres on the ships of river navigation, and four hundred kilometres on those of the oceanic navigation.

3. The installations shall be permanently

kept in good conditions of working, and capable of intercommunicating with the stations of the Republic.

4. The stations shall be in charge of persons well acquainted with the use of radiotelegraph apparatus.

5. The service of the stations shall be entirely in accordance with the provisions of the International Radiotelegraph Convention.

6. The agents of the companies will inform, before expiration of the time fixed, the General Inspector of the National Service of Wireless Telegraphy of the characteristics, system, power, etc., of the radiotelegraph apparatus to be fitted on the ships of their companies.

7. The ships which after expiration of the time fixed by Article 1 have not complied with the provisions of this Decree shall not be authorised to carry passengers in the harbours of the Republic.

8. Those ships which do not keep their wireless apparatus in proper working conditions shall be liable to have applied to them the penalty specified in the previous article (7).

9. The General Inspector of the National Service of Wireless Telegraphy is hereby entrusted with seeing that the provisions of this Decree are duly complied with.

VENEZUELA

THE Republic of Venezuela was formed in 1830 by secession from the other members of the Republic of Colombia. The Constitution in force is that of June 13th, 1914. Legislative authority is vested in a Congress of two Chambers, whilst the Executive Power is exercised by a President in conjunction with Cabinet Ministers. The twenty states, two territories and one Federal district of which it is composed cover an area of 398,594 square miles.

The territory included under the Administration of Venezuela is the same as that which was known, at the time South America was a Spanish colony, as "Capitania General de Venezuela," and extends from British Guiana on the east to the Republic of Colombia on the west. Its northern boundary is the Caribbean Sea, and its southern boundary the Republic of Brazil.

COPYRIGHT "GEOGRAPHIA" LTD 55 FLEET STREET LONDON E.C.4

There are included in the Venezuelan territory many islands in the Caribbean Sea, the principal being Margarita, Cubagua, Los Roques, Coche, Tortuga.

The superficial area of the country is 1,432,000 square kilometres.

The form of government is Federal Republican, democratic and representative. The Legislative power is exercised by two Chambers, the Senate and the Deputies, the former being representative of the different states, and the latter being representative of the people. The Federal States have administrative and financial autonomy. The Central Government devotes itself to the general interests of the country.

CONTROL AND ORGANISATION.

Wireless telegraphy has not yet been established as a public service, Trials have been made by individuals, but no permanent installation for public use exists. A small installation for students has been established at Puerto Cabello for the use of a Government School of Wireless Telegraphy. established in June, 1917.

Dr. Luis Soriano, former Director of the Physical Laboratory at the Central University, was the first to make experiments with wireless telegraphy in Venezuela.

Wireless telegraphy is under jurisdiction of the Central Government.

Private concerns are not allowed to erect or work wireless. The Government could at any time grant licences for the establishment of a wireless service by private companies or individuals.

As regards communication within the country, the right to establish public wireless communication is comprised in the State monopoly for any kind of telegraph communication, as indicated in the extract from the Laws relating to Telegraphs and Telephones printed here.

OFFICIALS CONTROLLING WIRELESS TELEGRAPHY.

<i>Official.</i>	<i>Title.</i>	<i>Address.</i>
Dr. Gumersindo Torres ..	Minister of Fomento	Caracas
Dr. C. Gimenez Rebolledo ..	Minister of War	Caracas
General Tobias Uribe ..	Director-General of Telegraphs and Telephones	Caracas
Dr. S. Key Ayala ..	Director of Posts and Telegraphs at the Ministry of Fomento	Caracas

There are no companies manufacturing wireless apparatus or engaged in wireless business of any kind in Venezuela.

There are no wireless societies, clubs, or publications in the country.

The National Government is considering the establishment of radio-telegraphy from two points of view, namely, as regards the working of a high-power station which will guarantee direct communication with Europe and the United States, and also as regards the interior service of the country.

With this end in view, tenders were invited for the construction of a large station and within the period fixed for such tender, viz., October 15th, 1919, three companies competed, but without, however, satisfying all the stipulations, it not being possible to determine exactly the cost of the station on the day it would be handed over, that is to say six months after its good working had been verified; therefore, in agreement with the conditions stipulated for the tenders above-mentioned, none of them was accepted, but immediately afterwards the Ministry of Public Works, to which the telegraph service is subject, was charged to instruct a technician who, as an employee of the Government, should study everything connected with the proposal in order to arrive at a solution which should satisfy the necessities of the country, which is the objective of the National Government.

Allied with the second point of view is the establishment of a small training station which shall serve for the training of operators. This station is of two kilowatts, Marconi system, situated at the high part of Caracas in front of the Bay of Catia which gives easy access to the waves transmitted towards the sea and has been able to maintain communication

with Curaçao and Trinidad. This station has not been brought into service. Three stations are desired, two of five and one of three and a half kilowatts, two of which stations will be established at the towns of Maracay and San Cristobal respectively. A portable military station has also been asked for for the use and instruction of officers of the Army.

By decree dated July 23rd of the present year was created the National School of Radiotelegraphy, an institution destined to provide the country with native operators for the service. The school is directed by Mr. H. R. von Eichwald, a Venezuelan by naturalisation.

For this same purpose three young Venezuelans were sent to the United States to study radiotelegraphy. These young men were granted an allowance by the Government, and have undertaken to return and lend their services to the country.

ADMINISTRATION.

The general subject of telegraphs and telephones is regulated under a law dated June 8th, 1918, and published in the *Gaceta Oficial*, the official organ of the Federal Government.

For the reasons that, as stated above, there are no wireless telegraph stations in Venezuela working regular traffic, no specific reference is made to radiotelegraphy in the Law; but it is covered under Article I, which reserves wireless as a State monopoly. That article runs as follows:—

"The National Government of Venezuela reserve for themselves the exclusive right to establish in the country any system already invented of telegraph and telephonic communication, and it deposes to the Ministry of Fomento the management of such systems."

The rest of the Law refers exclusively to the conditions upon which the Government may allow railway companies and certain other public corporations to establish private lines of telegraphs and telephones.

The Department of Public Works is dealing with the regulations of the service which will be done by Executive Decree, and in accordance with the Law regarding the national telegraphs and telephones which authorises the Executive power to fix the regulations of the telegraphs and telephones for any system invented or to be invented, and also in accordance with the specifications of the Convention of London, 1912.

VIRGIN ISLANDS

(See LEEWARD ISLANDS.)

WEIHAIWEI

(See CHINA, FOREIGN SETTLEMENTS.)

ZANZIBAR

THE island of Zanzibar, covering an area of 640 square miles, lies in 6° south latitude, and is separated from the mainland by a channel 22½ miles across at its narrowest part. It was not until during the sixteenth century that the Arabs of the East Coast succeeded in driving out the Portuguese, and the island was then attached (more or less nominally) to the rulers of Muscat. The supremacy of British interests in the island was recognised by other European States in 1890, Great Britain waiving all claims to Madagascar in favour of France, and ceding Heligoland to Germany.

The ruler of Zanzibar is a native Sultan; but the administration is conducted by a British High Commissioner and Resident.

ORGANISATION.

The Government maintains wireless stations in Zanzibar, Pemba (see map on p. 308) and Mafia.

ADMINISTRATION.

We append herewith the Decree issued by the Sultan in 1909 in regard to wireless.

WIRELESS TELEGRAPHY DECREE.

No. 6 of 1909.

In the name of the Most Merciful God.

It is hereby declared as follows:—

1. (1) No person shall establish any wireless telegraph station or install any apparatus for wireless telegraphy in any place in our dominions except under and in accordance with a licence granted in that behalf by our First Minister.

(2) Every such licence shall be in such form and for such period as our First Minister may determine, and shall contain the terms, conditions and restrictions on and subject to which licence is granted, any such licence may include two or more stations or places.

(3) If any person establishes a wireless telegraph station without a licence in that behalf or installs or works any apparatus for wireless telegraphy without a licence in that behalf, he shall be guilty of an offence against this Decree, and on conviction he shall be liable to a fine not exceeding 1,500 rupees, or to simple imprisonment for a term not exceeding twelve months, or to both, and in either case be liable to forfeit any apparatus for wireless telegraphy installed or worked without a licence, but no proceedings shall be taken against any person under this Decree except by the order of our First Minister.

(4) If the Court is satisfied by information on oath that there is reasonable ground for supposing that a wireless telegraph station has been established without a licence in that behalf, or that any apparatus for wireless telegraphy has been installed or worked in any place or on board any ship within its jurisdiction without a licence in that behalf, it may grant a warrant to any officer of our police to enter and inspect the station or place or ship, and to seize any apparatus which appears to him to be used, or intended to be used, for wireless telegraphy therein.

(5) Our First Minister may make regulations for prescribing the form and manner in which applications for licences under this Decree are to be made and fees payable on the grant of any such licence.

2. Where the applicant for a licence proves to the satisfaction of our First Minister that the sole object of obtaining the licence is to enable him to conduct experiments in wireless telegraphy, a licence for that purpose shall be granted, subject to such special terms, conditions, and restrictions as our First Minister may think proper, but shall not be subject to any rent or royalty.

3. No person shall work any apparatus for wireless telegraphy installed on any ship whilst that ship is in the waters of our dominions otherwise than in accordance with regulations made in that behalf by our First Minister, and our First Minister may by any such regulations impose penalties for the breach of any such regulations not exceeding 150 rupees for each offence, and may provide for the forfeiture on any such breach of any apparatus for wireless telegraphy installed or worked on such ship. Save as aforesaid, nothing in this Decree shall apply to the working of apparatus for wireless telegraphy installed on any foreign ship.

4. The term "ship" includes steamers, sailing ships, dhow, lighters, rafts, and every other form of boat. The expression "wireless telegraphy" means any system of communication by telegraph as defined in "The Indian Telegraph Act, 1883" without the aid of any wire connecting the points from and at which the messages or other communications are sent and received.

Provided that nothing in this Decree shall prevent any person from making or using electrical apparatus for actuating machinery or for any purpose other than the transmission of messages.

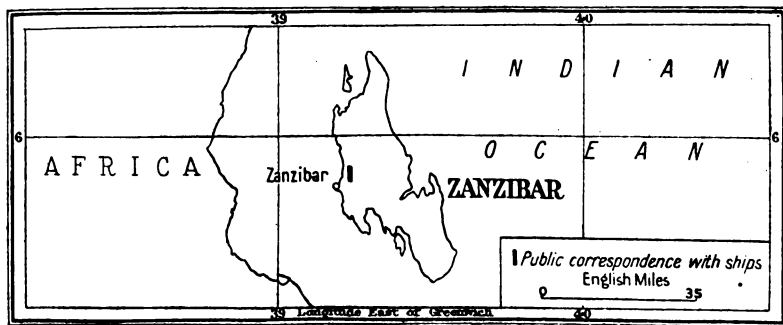

5. This Decree may be cited as "The Wireless Telegraphy Decree, 1909."

Given under our hand and seal this 9th day of February, 1909.

ALI-BIN-HAMUD.

Countersigned under the provisions of Article 47 of "The Zanzibar Order in Council, 1906."

JOHN H. SINCLAIR,
British Agent and Consul-General.

BELGIAN CONGO

(See map on page 120.)

FOUNDED in 1885 by the late Leopold II, King of the Belgians, the Congo "Free State" was placed under his sovereignty. It was subsequently annexed by Belgium under the Provisions of the Treaty of November 28th, 1907. The governing body of the colony consists of fourteen members, eight of whom are appointed by the King of the Belgians, three chosen by the Senate, and three by the Chamber of Representatives. The King is represented in the colony by a Governor-General assisted by several Vice-Governors-General. Its area is estimated at nearly one million square miles, and it possesses a population of about seven millions.

CONTROL.

The wireless telegraphic service of the Belgian Congo possesses a General Directorate at Brussels and a Local Directorate at Stanleyville, in the colony.

The network is divided into sections as follows:—

- (1) The section of the Bas-Congo-Kasai, comprising the stations of Banana, Boma, Kinshasa, Lusambo.
- (2) The section of the Equator: Coquilhatville, Basankusu, Umangi, Basoko.
- (3) The section of Stanleyville: Kilo.
- (4) The section of Lualaba: Kindu, Kongola, Kikondja, Lukuga, Elisabethville.

At the head of each section is a chief, assisted by chief operators of stations and constructional engineers.

ORGANISATION.

As a result of his travels in the Congo, King Albert was impressed with the great inconvenience caused by lack of suitable communication between the principal settlements of this vast colony, and decided from that moment to remedy this defect.

At the end of 1910 he drew up a programme in three parts of which the first consisted of linking Boma with Banana as a test. On the results obtained was to be considered the question of instituting another section, that of communication between Boma and Elisabethville, a much more important scheme in view of the fact that this part of the colony had never before made trial with wireless telegraphy. The third point included wireless communication between the Congo and Belgium, at first by means of relay stations, and subsequently direct.

In January, 1911, were installed the first two stations—at Banana and Boma—able to communicate with the coast station at Loango which was, in turn, the terminal point of a submarine cable. The same year the

King charged Mr. Goldschmidt and Captain (now Major) Wibier to instal a chain of stations in such a way as to form a wireless nexus throughout this vast territory. As a result Kinshasa, Coquilhatville, Lisala, Basoko, Stanleyville, Kindu, Kongolo, Kikondja, and Elisabethville stations were erected.

Latterly this network has been augmented, and during the war the stations of Kilo and Lukuga were opened to service. Actually there are fifteen wireless stations now working in the Belgian Congo. In addition there are under construction a station at Buta, in the district of Uele, and a powerful inter-continental station at Kanga (Boma), the latter destined for direct communication with Belgium.

Finally, steps are being taken which it is hoped will enable the three local capitals of Boma, Stanleyville and Elisabethville to directly inter-communicate without resorting to the use of relay stations.

The general traffic dealt with by the system exceeded 500,000 words in 1913, and 5,000,000 words in 1919.

There are no stations utilised for aviation purposes.

The stations at Kinshasa, Stanleyville and Elisabethville intercept press telegrams from Europe, which are distributed to the Colonial officials.

ADMINISTRATION.

The rules under which wireless telegraphy is administered in the colony are those of the Wired Telegraphic Service now in force. None is devoted specially to wireless.

WIRELESS TELEGRAPH STATIONS OF THE WORLD

A. Land Stations

B. Ship Stations

THE tables of land stations set out in the following pages should be consulted in conjunction with the maps showing the position of wireless telegraph stations inserted in the Laws and Regulations Section (see pp. 79 to 514). The stations have been grouped together under the names of the countries in which they are situated, and these countries have been arranged in alphabetical order; therefore no difficulty is likely to be experienced in locating any particular station. Aviation stations are shown in the apposite section of this volume.

The International Bureau has allotted to signatories of the Convention a list of combinations of letters to be used as call signals for stations proper to the respective countries. The letter limitations of these lists are given in this section, together with the names of the countries with which they are connected.

An alphabetical list of call letters for land and ship stations closes this section. The list indicates upon which page particulars of any station may be found.

Stations of a private or experimental character are omitted, unless exceptional circumstances warrant their inclusion.

Every effort has been made to attain the maximum degree of accuracy possible in these lists, but no responsibility can be accepted, however, in this connection.

The World's Land Wireless Stations open for Correspondence at 31st December, 1919.

.. Belize, while that vessel is plying between Trinidad and Tobago

¹ The station also exchanges public and official correspondence with Trinidad

² Eastern European time

³ Weather forecasts transmitted free of charge on request. Messages concerning navigation to any department or officer of the Government handled free of coast tax. Weather and ice reports from captain of a vessel also free of coast charge

⁴ For radiotelegrams sent by or addressed to the commander of a ship relating to the service of the ship the coast tax is reduced to fcs. 0.25 per word. The preamble of such messages should contain the service instruction SB

⁵ Cape Sable and Sable Island communicate with the land telegraph system through Camperdown

⁶ The retransmission charge between these stations and Camperdown is fcs. 0.30 per word. This charge is additional to the ordinary radio and land line rates

⁷ Atlantic standard time, 4 hours later than Greenwich time

¹ The long wave is used for inland correspondence
² Four hours later than Greenwich time
³ The station is open for inland correspondence
⁴ The station transmits a weather report at 0100 and a time signal at 1300 (Greenwich time). (For full particulars see International Time and Weather Signals—Chile.)
⁵ For reception
⁶ For transmission

fr. 0.25⁰⁰ additional for
each word over ten
* Italian Somaliland
official time, 3 hours in ad-
vance of Greenwich time

¹ Exclusively for the service of the steam ferry boats of the Strait of Messina

^a Radiotelegrams in plain language, Italian, French or English, concerning the movements and security of ships, and exchanged between the captains of ships and their owners or agents, are accepted

* This station is opened for public service direct to Italian Somaliland and Erythraea communicating with Mogadishio ISG (Italian Somaliland) and Massaua ICX (Erythraea)

* Maintains a continuous watch on 600 metre wave. Also performs a limited service for military purposes

**poses
' Serves Messina Radio
in the sector in which the
latter is "screened"**

INTERNATIONAL ALLOCATION OF CALL LETTERS

THE BUREAU INTERNATIONAL DE L'UNION TELEGRAPHIQUE OF BERNE allots to the various nations who are parties to the International Radiotelegraphic Convention combinations of "call" letters, which are in turn allotted to ship and land stations. Below we give a list of the letters, and combinations of letters, and the countries to which these have been assigned.

A	Germany.	OGA to OIZ	Denmark.
B	Great Britain.	OJA to OMZ	<i>Not yet allotted.</i>
CAA to CEZ	Chile.	OUA to OZZ	Denmark.
CFA to CKZ	British Possessions and Protectorates.	PAA to PIZ	Netherlands.
CLA to CMZ	Spain.	PJA to PJM	Curaçao.
CNA to CNZ	Morocco.	PJN to PJZ	Surinam.
COA to COZ	Great Britain.	PKA to PMZ	Dutch Indies.
CPA to CPZ	Bolivia.	PNA to PPZ	Brazil.
CQA to CQZ	Monaco.	PQA to PSZ	Portugal.
CRA to CRZ	Portuguese Colonies.	PTA to PVZ	Brazil.
CSA to CUZ	Portugal.	PWA to PWZ	Cuba.
CVA to CVZ	Roumania.	PXA to PZZ	Netherlands.
CWA to CWZ	Uruguay.	Q	<i>Reserved for abbreviations.</i>
CXA to CXZ	Spain.	R	Russia.
CYA to CZZ	Mexico.	SAA to SMZ	Sweden.
D	Germany.	SNA to STZ	Brazil.
EAA to EHZ	Spain and Colonies.	SUA to SUZ	Egypt.
EIA to EZZ	Great Britain.	SVA to SZZ	Greece.
F	France, French Colonies and Protectorates.	TAA to TEZ	Turkey.
G	Great Britain.	TFA to TFZ	Iceland.
HAA to HAZ	Hungary.	TGA to THZ	Greece.
HBA to HBZ	Switzerland.	TIA to TOZ	Spain.
HCA to H CZ	Ecuador.	TPA to TUZ	Norway.
HDA to HEZ	<i>Not yet allotted.</i>	TQA to TTZ	Norway.
HFA to HFZ	Czecho-Slovakia.	TVA to TZZ	Netherlands.
HGA to HHZ	Siam.	UAA to UMZ	France, French Colonies and Protectorates.
HIA to HIZ	Dominican Republic.	UNA to UNZ	<i>Not yet allotted.</i>
HJA to HKZ	Colombia.	UOA to UOZ	Austria.
HLA to HNU	Spain.	UPA to UPZ	Italy.
HNV to HNZ	New Hebrides.	VAA to VGZ	Canada.
HOA to HZZ	France, French Colonies and Protectorates.	VHA to VKZ	Australian Commonwealth.
I	Italy and Colonies.	VLA to VMZ	New Zealand.
J	Japan and Possessions.	VNA to VNZ	Union of South Africa.
KAA to KCZ	Germany.	VOA to VOZ	Newfoundland.
KDA to KZZ	United States of America.	VPA to VSZ	British Colonies and Protectorates not autonomous.
LAA to LHZ	Norway.	VTa to VWZ	British India.
LIA to LRZ	Argentina.	VXA to VZZ	British Colonies and Protectorates.
LSA to LUZ	Great Britain.	W	United States of America.
LVA to LVZ	Guatemala.	XAA to XDZ	Mexico.
LWA to LWZ	Norway.	XEA to XMZ	Great Britain.
LXA to LZZ	Bulgaria.	XNA to XSZ	China.
M	Great Britain.	XTA to XZZ	Great Britain.
N	United States of America.	Y	Great Britain.
OAA to OBZ	Peru.*	Z	Great Britain.
OCA to OFZ	Great Britain.		
ONA to OTZ	Belgium and Colonies.		

* Provisionally.

CALL LETTERS

(Alphabetically arranged)

ALLOTTED TO LAND AND SHIP STATIONS.

b = Ship Station.

c = Land Station.

RADIO-COMMUNICATION AND METEOROLOGY

BY LT.-COL. E. GOLD, D.S.O., F.R.S.,
Assistant Director of the Meteorological Office.

I.—GENERAL.

METEOROLOGY may be divided broadly into two great branches—(a) “climatology,” or the analysis and classification of the records of past weather, and (b) “weather forecasting,” or the deduction of future weather from the present and past conditions. Each of these main branches has numerous ramifications, and neither can be regarded as independent of the other; indeed, climatology depends for its usefulness mainly on the fact that future conditions will on the average be nearly identical with past conditions, and climatology is in this respect generalised forecasting. When the children of Israel left Egypt for Palestine they put their trust in a climatological “forecast.” When the British Army, on the evening of November 19th, 1917, issued orders for the attack on Cambrai to begin the following morning, it put its trust in a “weather forecast”—a weather forecast so excellent that the General commanding the Tank Corps which led the attack characterised it as a forecast as accurate as a description could have been of the wind, weather and visibility.

Both types of information are essential to success in peace as in war. The transport company which issues instructions for precautionary measures against frost at the beginning of each winter relies on a climatological forecast; a wise company will utilise the information given in weather forecasts of the probable termination of a mild spell in winter to draw the attention of all concerned to the precautionary measures. The man who contemplates the erection of sheds for drying timber wants a climatological forecast of the winds, the rainfall and the humidity, so that he may choose the most suitable place available, and so that he may give his sheds the correct orientation, and know beforehand how much natural drying he can, in the long run, depend upon. The road surveyor who contemplates tarring a stretch of road wants a “weather” forecast so that he may not find his tarring operations wasted by a heavy fall of rain immediately afterwards.

These examples have been chosen because they refer to aspects of meteorological usefulness which are not so obvious as the applications to agriculture, fishing and aviation.

It has been said that the function of science is to replace experience, to enable one man to profit by the experience of another, and to save him the troubles and disappointments which are the inevitable companions of the man who insists on accumulating unnecessary experience for himself. In no branch of science is this *economy* more marked than in meteorology. The experience of an observer on a lonely island in the Hebrides, interpreted by the scientific expert in meteorology, may save the Yarmouth fishing fleet the loss of its nets, perhaps even the

lives of its sailors. A few readings of the barometer plotted on a chart furnish to the expert the means of supplying to the artillery the wind in the upper air to be allowed for in shooting, when no direct means of observing that wind are available.

Wireless telegraphy is directly applicable only in the preparation and distribution of "weather" forecasts; but since climatological forecasts must give the average conditions and frequency of occurrence of precisely those weather characteristics which are necessary for an accurate description of existing weather and for a "weather" forecast, climatology will in the end depend very largely upon the observations which wireless telegraphy transmits, as these are the observations which will be most generally recorded and most carefully scrutinised.

II.—METEOROLOGY AND WAR.

(a) *Troy to Waterloo.*

The importance of the weather in military operations is shown in history from the earliest times. Sir Napier Shaw, in the "Weather Map," quotes an episode in a Syrian campaign illustrating its control of Q.

"Now they that were in the town sent messengers unto Tryphon to the end that he should hasten his coming unto them by the wilderness, and send them victuals.

"Wherefore Tryphon made ready all his horsemen to come that night; but there fell a very great snow, by reason whereof he came not."

Even earlier than this, the Greek fleet was kept by contrary winds for weeks on the western side of the Ægean Sea until the leaders were at their wits' end for expedients to keep the growing dissatisfaction in the ranks from breaking up the expedition against Troy. Achilles' caustic comment on the weather prophet of that time is still appropriate to those quacks who pretend to an intuitive perception of future weather: "The prophet! What is he? A man who speaks 'mongst many falsehoods but few truths, whene'er chance leads him to speak true."

Hannibal's grand campaign failed largely owing to the imperfectly realised climate of the Alps in October.

A spell of north-east winds in September, 1066, kept William the Conqueror's fleet on the shores of Normandy and brought Harold Hardrada to the Yorkshire coast; the English Harold was drawn from his defence against the Norman, lost officers and men whom he could ill spare in the hard-won victory of Stamford Bridge, and returned to find that the break up of the spell had permitted William to cross the Channel and effect a landing unopposed. The north-east winds of that September were as momentous as any in history.

In July, 1588, the same south-westerly breeze before which the Spaniards sailed up the English Channel indicated "a depression on the Atlantic," the precursor of the stormy series which consummated the destruction of the Armada.

The thick morning mist at Blenheim on August 13th, 1704, enabled Marlborough to surprise the French and gain the initial advantage in that critical battle.

The heavy rain during June 17th, 1815, and the following night was responsible for Napoleon's delay in beginning the battle of Waterloo on the 18th; besides rendering the ground more difficult for his attacks, the rain therefore made a further contribution to his utter defeat by the postponement which gave time for Blücher and his army to reach the field and take part in the final stages of the battle.

(b) *The Crimean War and the Birth of Synoptic Meteorology.*

In all these cases the weather had been regarded as an unforeseeable, unavoidable blessing or calamity; but a new era dawned in the middle of the nineteenth century with the invention of the electric telegraph and the progress of scientific enterprise; the final stimulus came from war, or rather from an incident in a campaign where even a fair "climatological" forecast would have saved the British Army untold loss and suffering. On November 14th, 1854, during the Crimean war, a storm burst suddenly upon the British and French fleets in the Black Sea, and did much damage, wrecking one French battleship. The French astronomer, Leverrier, joint-discoverer with John Couch Adams of the planet Neptune, collected evidence which showed that the storm had travelled across Europe and might have been foreseen, had telegraphic reports been available at a central office. Actually, indeed, a project of this kind had been advocated in England in 1848 at the annual meeting of the British Association for the Advancement of Science, but sufficient support was not forthcoming to give effect to the proposal, although the *Daily News* had published in June, 1849, a collection of reports from about thirty places. Leverrier's report made the French Government move; and the meteorological department of the British Board of Trade, established in 1854 under Captain (afterwards Admiral) Fitzroy, also took steps to organise a telegraphic system of reports, being stimulated further in its efforts by the "Royal Charter" storm of October 26th, 1859. After organising a system for collecting reports, Fitzroy also inaugurated a scheme of storm warnings and weather forecasts, before he had satisfied the scientific society of his day that these forecasts and warnings were established on a sound basis of principle; criticism and opposition arose, and Fitzroy died an untimely death in April, 1865; at the end of the following year the forecasts were discontinued for thirteen years until 1879, although the warnings of storms were recommenced in 1867, after a brief interval, their renewal being apparently due to pressure through Parliament.

(c) *The European War.*

At the outbreak of the European war in 1914 there was a tolerably complete network of meteorological stations in Europe contributing observations daily at 0700 Greenwich time, and for a few stations, again at 1800; additional reports were also made at 1300 or 1400, mainly for use during the summer months in the preparation of harvest forecasts, although in France the reports at 1400 were more general and more fundamental in the organisation of their service than the reports at 1800.

None of the military services, however, understood the importance and the power of the scientific development of meteorology which had taken place in the preceding 35 years; the forecasts in the daily Press

constituted the meteorological pabulum of 99 per cent. of the nation, and these were over twelve hours old before they were read; of the functions of meteorology outside these forecasts hardly any conception existed. The principal aim of those in power was to prevent the enemy securing meteorological reports, whereas this should have been a matter of secondary importance compared with the necessity for a right use by ourselves. Lieut. J. Rouch, of the French Navy, who was head of the French military meteorological service in 1916-17, relates that in April, 1915, a French Admiral, attached to the Army, busied himself with the preparation of a weather chart. To someone who evidently thought he might have been better employed the Admiral remarked: "I know that we are forbidden to publish meteorological observations to the enemy, but I did not know that we pushed the spirit of chivalry so far as to interdict their use by ourselves."

When the first Zeppelin raid was effected and bombs dropped in the Eastern Counties, my suggestion that the objective had been London and that the design had been frustrated by an unanticipated upper wind was immediately verified by the meteorological reports. This information stimulated the military authorities, and as it was shortly followed by the first German gas attack a move was made towards the establishment of a military meteorological service in the field. This began in June, 1915, in France. Col. H. G. Lyons, F.R.S., inaugurated the service at St. Omer on June 10th, and then returned to London to arrange for a service at Gallipoli. The development of the service was gradual, but the wonderful elasticity of the British Army allowed much to be done for which no authorised establishment existed. With the prospect of a direct use of wind in retaliatory gas attacks the Army Command felt it necessary to test beforehand the accuracy of the forecasts; they stood the test so well that the decision to attack at Loos on September 25th was taken the preceding evening, at a time when the wind was blowing strongly from south-east, on the strength of the meteorologists' forecast of a change to south-west in the interval between the decision and the time of attack; the change occurred as predicted, though three hours after the discharge of gas the wind changed back to the east side of south. This was the first of a long series of gas attacks, of which the most brilliant, from a meteorological point of view, occurred in March, 1918. On that occasion, gas was projected on the advice of the meteorologist in a light westerly wind, although the wind ten miles west of the place of discharge was *easterly*.

Wireless was not used in the war on land for the distribution of meteorological information so much as it might have been. This was partly due to the slow development of the "continuous wave" system which was essential to success.

In 1916 the distribution of reports to the Artillery appeared eminently a task for wireless. These reports contained the particulars of wind and temperature required by the gunners to admit of accurate shooting from the map: they were issued from Army Headquarters and transmitted to each battery: to ensure the best results it was essential that the reports should reach the batteries within one hour of the time of issue. Under normal conditions this was achieved by ordinary telegraphy, but during a battle delays were frequent. The significance of this was, however, inadequately realised in 1916 and the Artillery experts thought it inexpedient to alter the then existing

method of distribution, although the Royal Flying Corps was willing to use its wireless service in co-operation. A year later the Artillery were ready to adopt wireless, but by that time the methods of aerial warfare had changed so much that the Royal Flying Corps was unable to lend the necessary co-operation of its wireless personnel and instruments; and the resources of instruments and trained personnel outside the Flying Corps were quite inadequate to permit of the reception at the batteries of broadcasted meteorological messages issued every four hours. Besides these reports to the Artillery, "Meteor Reports," as they were called for brevity, additional similar reports were required by the sound-ranging sections, as the effect of wind and temperature on sound-ranging could only be allowed for by a rapid distribution of special meteorological reports every hour during sound-ranging weather. These were distributed by wireless in 1918.

As night-flying developed the need for short-period forecasts, covering about six hours, and rapidly distributed, was emphasised; and in 1918 these were distributed in code twice each evening by wireless from Montreuil; in 1918, too, reports of upper winds up to 20,000 feet were also issued by wireless for the use of the Royal Air Force; each of these reports indicated the information on which it was based and the changes anticipated before the next report issued four hours later.

The Germans distributed reports of meteorological conditions by wireless as early as 1916. At first, the information was mainly a statement of conditions in the upper air at Bruges, and this was received by the British meteorological service and utilised in connection with other reports, the observations of temperature and humidity at different heights being regarded as the most valuable data in the messages. Later on, German reports were issued by wireless from several bases and an examination of the reports issued in 1918 indicated that they had adopted the British system of ballistic winds and temperature; but it also showed that changes of wind were usually anticipated by the British service two to four hours earlier than by the German service, so that the British gunners were better served in this respect than the German.

III.—THE EXISTING FORECAST SYSTEM OF WESTERN EUROPE, AND THE CONSTRUCTION OF WEATHER CHARTS.

The principal features of the existing system of forecasting may be outlined as follows:—

1. A network of observing stations exists at which coastguards, lighthouse keepers, schoolmasters, clergymen, and others, make observations two, three or four times daily at 0100, 0700, 1300 or 1400, 1800, and transmit their observations, either immediately or with those for the following time of observation, by telegraph to a national headquarters.

These reports are made in a simple code consisting essentially of two five-figure groups, in which the barometer (three figures), the wind (three figures) and the temperature (2 figures) are given as accurately as the observations permit; of the remaining two figures, one is utilised for reporting the weather at the time of observation and the other for indicating the direction of motion of upper cloud or the weather since the preceding report, according to the time at which the report is made.

These two fundamental groups are supplemented invariably in the more advanced countries by a third group giving the character and magnitude of the barometric change in the three hours preceding the time of the report (three figures); the remaining two figures of this group are allotted to rainfall in reports at 0700 and for varying purposes in reports at other hours. There is a further supplementary group at 0700 giving the maximum and minimum temperature (four figures) and the sea disturbance (one figure).

This is the so-called "old international system," introduced after a congress at Utrecht in 1874 and modified at Berlin 1910 and at Rome 1913. Its use for the exchange of reports between different countries is gradually ceasing, and most services have already introduced additional information into their reports for national purposes.

2. This network of semi-official stations is supplemented by a few observatories at which fuller records are maintained, but the reports are usually in the same code as those from the semi-official stations. Reports of the wind obtained by observation of small free balloons are, however, often added three or four times daily when weather conditions permit the balloon to be watched to a reasonable height by the special theodolite used for this work.

3. The reports referred to in 1 and 2 are collected at the central office and transmitted, usually by air-line or cable, but in a rapidly increasing number of cases by wireless, to other national central offices.

4. The home and foreign reports obtained as described are decoded at the central office, tabulated and charted. The fundamental reason for charting the observations is well stated by the astronomer Halley in presenting to the Royal Society in 1686 an account of the trade winds. He says: "To help the Conception of the Reader in a Matter of so much Difficulty, I believed it necessary to adjoyn a Scheme, showing at one View all the various Tracts and Courses of these Winds: whereby 'tis possible the Thing may be better understood than by any verbal Description whatsoever."

The charts of the present day portray the pressure, the temperature and the weather, as well as the wind and the character of the changes of pressure in progress, while supplementary charts indicate the distribution of cloud, of upper wind, of visibility and of the weather since the last report. The fundamental chart remains that of pressure, wind and weather.

No two charts for an extensive region are alike, but a brief examination of a series of charts shows that some features in the distribution of pressure are always recurring and are accompanied by weather of the same general character. Most prominent are regions of low and high pressure in which the isobars form closed curves. These are called cyclones and anti-cyclones respectively. The term cyclone was introduced by Piddington about 1846 in connection with the circular storms of the Bay of Bengal and Indian Ocean. It has been generally adopted, but is now used to denote the more extensive but less intense depressions of temperate latitudes, while Piddington's cyclones are frequently distinguished as "tropical." The term "anti-cyclone" was introduced in 1863 by the famous meteorologist and anthropologist, Francis Galton, author of *Meteorographica*.

Broadly speaking, in an anticyclone quiet, rainless weather

prevails; the sky may be overcast or it may be cloudless, and different parts of the same anticyclone may be different in this respect; but wherever the cloud exists there is practically always an increase of temperature just above its upper limit. There are, however, exceptions to this general rule of rainless weather and occasionally quite heavy rain occurs in some part of an anticyclonic region. In cyclones, on the other hand, the weather is usually unsettled and windy: rain does not fall over the whole area, but very few cyclones are free from rain in some parts.

The charts prepared at the central office are compared with the immediately preceding charts and with similar distributions in previous years, the latter comparison being partly conscious and partly subconscious. The well-known relation between the wind and the pressure distribution is considered and the effects of radiation and temperature differences, horizontally and vertically, are taken into account and a forecast prepared of the changes in the distribution of wind, weather, temperature, cloud and visibility. All this is done at the central office and the accuracy with which the trained expert can balance the evidence and arrive at a definite judgment is surprising.

5. The principal weakness of the system is its onesidedness: the organisation is practically devoted to the collection and analysis of the reports: the distribution of the information after it leaves the central office is in non-professional hands. This weakness was recognised before the war and the need for local distributing centres was pressed, but funds were not available for their establishment. A concurrent and consequent weakness is the inability of a central forecasting office to estimate and allow for the variety of detail which characterises the weather of a sub-area: the central office inevitably generalises the weather of an area: the local forecaster is able, on the other hand, to concentrate his whole attention on the weather of his area and to emphasise the important details. It might be thought that this could be remedied by allocating different areas to different forecasters at headquarters, but in practice this would involve a vast centralisation of local reports and it would ignore the fact that a forecaster is human and feels the keenest interest in the weather of the region which he occupies. A further defect in the existing system is the lack of differentiation between the requirements of meteorological exchange between neighbouring countries and the exchange between countries long distances apart. In the next section an indication will be given of the manner in which these defects are likely to be remedied. Some progress has already been made in the British Meteorological Service by the location of professional meteorologists in various places, mainly at aerodromes such as Croydon, Lympne (Folkestone), Calshot (Southampton), Plymouth, Manchester, Baldonnell (Dublin), Cranwell (Lincoln), Howden (near Hull), Renfrew, Felixstowe, Isle of Grain.

It remains to add here that in pre-war meteorology wireless was used mainly for collecting reports from ships in the Atlantic; practically the only collective reports issued were those from the Eiffel Tower at 1000 and 1700 G.M.T. At the present time collective reports are being issued by wireless all over the world. The leading ones in Europe are: Eiffel Tower, Air Ministry, Scheveningen, Warsaw, Prague, Nauen (Berlin), Copenhagen, Rome, Christiania, Karlsborg (Sweden), Reval.

IV. — FUTURE DEVELOPMENTS.

The general plan is outlined in its meteorological aspect in Annex G of the Convention relating to International Air Navigation [Peace Conference, Paris, 1919]. The necessary auxiliary wireless arrangements are set out in a communication by Colonel Blandy, D.S.O., R.A.F., to a conference of meteorologists of the British Dominions in London, September, 1919.

A summary of the schemes, with modifications, is given here.

First, international hours of observation for the reports, on which synoptic charts are to be based are selected on the principle that they should be frequent enough for all practical purposes and so chosen that they could be adopted all over the world with the minimum alteration of existing times of report. The hours selected are 0100, 0700, 1300, 1900 Greenwich Mean Time.

Secondly, the symbols or letters for use in specifying meteorological codes are set out and defined so that they can be used everywhere with a single definite meaning. They are as follows:—

BBB=Barometer reduced to sea-level and expressed in millibars and tenths—*i.e.*, corrected for temperature, gravity, and index error. Initial 9 or 10 omitted.

BB=Barometer reduced to sea-level and expressed in *whole* millibars. Initial 9 or 10 omitted.

DD=Direction of wind (true direction, as distinguished from magnetic—on scale 1-32).

F=Force of wind on Beaufort Scale (wind above force 9 to be specially noted at end of telegram).

D₁=Direction of motion of low cloud [2=east, 4=south].

V₁=Speed of low cloud [1=0-9, 2=10-18, 3=19-27 m.p.h., etc.].

ww=Present weather (special code).

TT=Temperature in degrees.

T₁T₁=Temperature of sea.

A=Form of low cloud [cumulus, nimbus, stratus, etc.].

L=Amount of low cloud [in tenths of sky covered, amount 10 telegraphed as 0].

a=Form of medium or high cloud [cirrus, alto-cumulus, etc.].

N=Amount of total cloud, in tenths.

h=Height of base of low cloud.

W=Weather since preceding report (special code).

V=Visibility (special code).

H₁=Relative humidity (special code).

S=State of sea and swell at coast stations.

K=State of sea and swell in open sea.

d=Direction of swell.

c=Characteristic of barometric tendency.

bb=Amount of barometric tendency in half-millibars per 3 hours : 50 added for negative tendencies.

RR=Rainfall in millimetres and tenths since last report.

MM=Maximum temperature in day.

mm = Minimum temperature in night.

r = Time at which rain or hail or snow or sleet began.

x = Check figure.

SPECIAL SYMBOLS FOR UPPER AIR REPORTS.

Wind.

h = Height above ground.

DD = Direction (scale 1-36).

VV = Speed in kilometres per hour (for speeds above 99 km. hr. add 50 to wind direction).

Pressure, Temperature, and Humidity.

BB = Pressure.

TT = Temperature (as above).

H = Relative humidity.

To these must be added the symbols for specifying the position of a reporting ship at sea :—

LLL = Latitude (degrees and tenths).

llll = Longitude (degrees and tenths).

Q = Quarter of globe in which ship is.

Thirdly, forms of report from individual stations or ships are chosen so that they will give the requisite information about the meteorological conditions at each place and will be readily incorporated in collective reports for transmission from local centres to national headquarters, and from national headquarters to distributive centres and to other national headquarters.

They are as follows, where each letter is replaced in actual reports by the appropriate figure giving the conditions at the time and place of report :—

(a) Reports for Synoptic Charts. Land Stations.

BBBDD FwwTT cbWVH ALANh RRMMr (orRRmmr).

(b) Reports for Synoptic Charts. Ships at Sea.

QLLLx llllx BBDDx FVKdx wwGGx TTT₁T₁x ANWrx yyyyz

(c) Reports of Wind and Weather at Auxiliary Land Stations or for Hourly Reports from Stations on Aerial Routes.

DDFD₁V₁ ALANh wwWVV₁ BBBK₁2D₂D₂V₂V₂.

These three forms of report, (a), (b), (c), are to be used in exactly the same form for collective messages : the information for each place or ship is preceded by a call sign for the station or ship in order to prevent any risk of mistake as to the place to which the information refers ; such mistakes are easily made if groups of figures are sent according to a fixed order of stations, especially when part of the collective message fails.

For collective reports of Class 1 the forms (a) and (b) are used. These reports therefore give full details for synoptic charts and for printed Daily Weather Bulletins.

For collective reports of Class 3 the form (c) is used. These therefore give the necessary local information to supplement the national

synoptic chart : and all that is required for aeroplane services on fixed routes.

For collective reports of Class 2 the following form is used :—

BBBDD FwwTT

the information for each place being preceded by the appropriate call sign.

These reports are intended for use in countries separated by long distances from the issuing country, *e.g.*, England and Italy, France and America.

It is not necessary that a meteorological office at Rome should have all the details of the meteorological conditions in the British Isles; but it is essential that it should have sufficient information to make a general synoptic chart and to know in broad outline what the distribution of weather is. It is further necessary that the meteorological office at Rome should know that the meteorological expert in London anticipates will be the weather changes in the next 10 to 20 hours. Accordingly, provision is made for the inclusion in collective reports of Class 2 of a brief forecast for each country whose reports are given in the message.

If different central offices are, for a moment, denoted by letters P, Q, R, . . ., and the different *local* centres in each country are denoted by letters with suffixes, P₁, P₂, P₃, . . . Q₁, Q₂, Q₃, . . ., then, under the scheme outlined, the following information will be available :—

At each central office P :—

(i.) Full reports for a selection of stations in each of the countries, P, Q, R . . . within a radius of 1,500 kilometres.

(ii.) Abbreviated reports of all countries, P, Q, R . . ., within a radius of 3,000 kilometres.

(iii.) Details of wind and weather for all sub-areas, P₁, P₂, . . ., Q₁, Q₂, within a radius of 500 kilometres.

(iv.) A 10 to 20-hour forecast for each country, P, Q, R

(v.) A short forecast covering 5 to 10 hours for every sub-area, P₁, . . ., P₄, P₃ . . ., in country P, and for sub-areas in other countries within a radius of 500 kilometres.

At each local centre P₁ . . . :—

(i.) Full synoptic charts for country P and neighbouring countries of the group.

(ii.) Full details for sub-area P₁ and all contiguous sub-areas.

(iii.) Forecasts for short periods for sub-area P₁ and contiguous sub-areas.

(iv.) National forecasts for 24 hours or more for country P.

The principal features of the codes referred to in the above definition of symbols are as follows :—

Two figures (01 - 99) are used to denote the weather conditions and provision is made for indicating the character and intensity of precipitation, *e.g.*, thick drizzle, slight snow, moderate rain, heavy rain, passing hail showers, continuous heavy snow.

Four figures are used to indicate the forms of cloud and the amounts of different forms present.

One figure is used to denote the height of the lowest cloud present.

One figure is used to denote the degree of relative humidity.

One figure is used for the visibility.

One figure is allocated to report the swell of the sea, and simultaneously to indicate the general character of the waves.

One figure is used to indicate the time at which precipitation began to fall.

All this information is additional to that given hitherto in telegraphic reports, and represents the meteorologist's advance in dealing with the problem of furnishing accurate weather reports.

The "communications" arrangement are briefly as follows:—

In each country the national arrangements for collecting and distributing information for national purposes is left to the nation concerned—telegram, telephone, and wireless will probably all be used. Communication to aeroplanes in the air will be by wireless telephony, and usually in plain language from the decoded reports of class (c).

For collective reports of Class 3 each country will also make its own arrangements; but, as these will frequently be hourly reports for use on aerial routes, neighbouring countries will be kept informed of details as to times of transmission and wavelengths. For example, from Great Britain to France such transmission is already being made on a wavelength of 1,400 m. at each hour from 0745 to 1445.

For other collective reports the following groups and sub-groups of countries have been arranged:—

- A1. British Isles.
- A2. Iceland, Denmark, Norway, Sweden.
- A3. Archangel, Esthonia, Finland.
- B1. France, Belgium, Holland.
- B2. Spain, Portugal.
- B3. French North Africa.
- B4. Switzerland.
- C1. Italy, Malta, Serbia.
- C2. Egypt, Libya, Palestine.
- C3. Greece, Roumania, Constantinople.
- C4. Poland, Bohemia.
- D1. Germany.
- D2. Austria.
- D3. Russia in Europe.
- E. Africa (not included under B and C).
- F. North America.

For collective reports, Class 1 the different sub-groups will transmit according to the following scheme:—

Observations made at 0100.

Wavelengths ..	4,200	3,900	3,700	3,500
Times of Issue.				
0230	Group A1.	Group B1.	Group C1.	Group D1.
0245	Group A2.	Group B2.	Group C2.	Group D2.
0300	Group A3.	Group B3.	Group C3.	Group D3.
0315	—	Group B4.	Group C4.	—

Radio-communication and Meteorology

A similar procedure will be followed for observations at 1300, 1900. This permits 1½ hours as a minimum, for the collection of observations and the preparation of the coll message.

Collective reports, Class 2, are to be transmitted from four transmitting stations in Europe as follows:—

Group A.	Stavanger	Wavelength, 9500.
Group B.	Lyons	Wavelength, 15,500.
Group C.	Rome	Wavelength, 10,850.
Group D.	Nauen	Wavelength, 12,600.
Group E.	—	—
Group F.	Annapolis (?)	Wavelength, 17,000.

These reports will be transmitted simultaneously at 0400, 1600, 2200, by G.M.T.—i.e., three hours after the times of observation and forty-five minutes after the latest time for the transmission of Class 1 reports for the corresponding hour of observation. The punctual issue of these reports will depend on the time-table for reports being strictly adhered to.

It is seen that when this scheme is working it will be possible to make a synoptic chart for the area extending in longitude from 10° W. to the Ural Mountains, and in latitude from the Equator to the Arctic Circle; and to complete it within four hours of the time of observation. This should furnish all that is required for navigation of aeroplanes in the area concerned, and should also furnish the meteorologist in the position to give general forecasts for three days ahead at least on the majority of occasions, especially for those less critically situated than the British Isles.

There is one further development in which wireless telegraphy is going to be of the greatest assistance to meteorology. Great progress has been made in recording atmospheric conditions and the direction from which they come. Already it has proved possible with a single station with confidence that there was practically no risk of thunderstorms on a particular route, although thunderstorms were indicated in other directions in the region in which the station was situated. A direction finder for thunderstorms can now be made with a coil 5 ft. by 4 ft., rotated about a vertical axis until the position of maximum intensity is found. The sensitiveness of this detector used with mionics valves is remarkable, and it is a relatively inexpensive instrument. It is almost certain to prove an indispensable part of the meteorological equipment of every local meteorological centre. That it is achieved it will probably prove feasible to follow the storm weather. The use of atmospherics in meteorology is practised in the embryo stage at present; he would be a bold man who set to the developments which may come when these form part of collective information at the disposal of the headquarters expert.

A similar procedure will be followed for observations at 0700, 1300, 1900. This permits $1\frac{1}{2}$ hours as a minimum, for the national collection of observations and the preparation of the collective message.

Collective reports, Class 2, are to be transmitted from four main transmitting stations in Europe as follows:—

Group A.	Stavanger	Wavelength, 9500.
Group B.	Lyons	Wavelength, 15,500.
Group C.	Rome	Wavelength, 10,850.
Group D.	Nauen	Wavelength, 12,600.
Group E.	—	—
Group F.	Annapolis (?)	Wavelength, 17,000

These reports will be transmitted simultaneously at 0400, 1000, 1600, 2200, by G.M.T.—*i.e.*, three hours after the times of observation and forty-five minutes after the latest time for the transmission of the Class 1 reports for the corresponding hour of observation. The punctual issue of these reports will depend on the time-table for Class 1 reports being strictly adhered to.

It is seen that when this scheme is working it will be possible to make a synoptic chart for the area extending in longitude from Vancouver to the Ural Mountains, and in latitude from the Equator to the Arctic Circle; and to complete it within four hours of the time of observation. This should furnish all that is required meteorologically for navigation of airships in the area concerned, and should put the meteorologist in the position to give general forecasts for three or four days ahead at least on the majority of occasions, especially for areas less critically situated than the British Isles.

There is one further development in which wireless telegraphy is going to be of the greatest assistance to meteorology. Great progress has been made in recording atmospheric and the direction from which they come. Already it has proved possible with a single station to say with confidence that there was practically no risk of thunderstorms on a particular route, although thunderstorms were indicated in other directions in the region in which the station was situated. A wireless direction finder for thunderstorms can now be made with a coil about 5 ft. by 4 ft., rotated about a vertical axis until the position of minimum intensity is found. The sensitiveness of this detector used with thermionic valves is remarkable, and it is a relatively inexpensive instrument. It is almost certain to prove an indispensable part of the instrumental equipment of every local meteorological centre. When that it is achieved it will probably prove feasible to follow the path of each thunderstorm and to devise a method of advising airships and aeroplanes *en voyage* of the course to be taken to avoid thunderstorm weather. The use of atmospheric in meteorology is practically in the embryo stage at present; he would be a bold man who set limits to the developments which may come when these form part of the collective information at the disposal of the headquarters expert.

WIRELESS AND TIME

BY ARTHUR R. HINKS, M.A., F.R.S., Secretary of the Royal Geographical Society.

AT the outbreak of war there was in progress a new determination of the difference of longitude between Paris and Saint Petersburg, as it then was; or, more precisely, between Paris and the Imperial observatory of Pulkovo. To-day we know no more of that famous observatory than that it has been under the "direction" of two Bolshevik soldiers; that the recent fighting between the Reds and the forces of Denikin has swayed backwards and forwards over the hill on which the observatory stands, or stood; and that there is only too much reason to fear for the survival of what was the most renowned institution of its kind: the national observatory, whose first concern is with the very fundamentals of astronomy. The wireless determination of the Paris-Pulkovo longitude was an important step in that revision of the primary longitudes of Europe required by the ever-increasing demands of Geodesy, that is no longer content with the earth as a spheroid of revolution, but must examine afresh with all possible refinement the discordances between the astronomical and the geodetic, or between the wireless and the surveyed differences of longitude, in order to determine those anomalies of the vertical, that is, of the direction of gravity, that are essential to the construction of the "geoid."

During the years of war astronomers and surveyors have turned to less fundamental, but more imperative, needs. The escorts of armoured cars have lain out all night under arms in the deserts of Arabia, Egypt, and Mesopotamia, while astronomers with temporary commissions in the Royal Engineers have "counted the stars," or determined time and latitude, with time signals from the Eiffel Tower or, what amused them more, from Nauzen for the derivation of the longitude. Thanks to wireless, it is now, for the first time, possible to place the Hedjaz railway accurately on the map of Arabia; and the methods of desert reconnaissance survey under conditions of war have been wonderfully developed by the Survey of Egypt; while the longitudes of the surveys in Mesopotamia depend on the time signals from the central wireless station at Basra. Very little has been published as yet on the technical experiences of these survey parties, and perhaps there is not much to tell, for we know from the reports of Cav. De Filippi's expedition in the Karakorum in 1913 that the field determination of longitude by wireless offers no particular difficulty. Geographers will, however, be anxious to know more of the possibilities of valves worked with primary batteries, and of the use of growing trees as aerials in the manner developed by the United States Signal Service. The latter method appeals especially to the surveyor in the forests of the Amazon or the Congo. Dr. Hamilton Rice, on the Amazon, found at first much difficulty in hoisting his aerial in the forest. He has just returned to that river for a further tour of exploration and survey, and we may hope to learn much of the possibilities of turning the forest to good account in the new method.

The surveyor, who can hardly be expected to follow the rapid transformation of wireless ideas and their somewhat bewildering technique, would be grateful for a little dogmatic advice on such questions as the relative efficiency of tall aerials and coils, and the saving of weight to be carried which may be effected by the latter. When a single traveller, with no skilled assistance, can set up his wireless gear in a few minutes, then we shall have, indeed, the long-desired revolution in methods of desert survey, to which the excellent work of the French in the Sahara pointed the way, and the work of our surveyors in the Eastern warfare has doubtless contributed much.

There is an important point in these astronomical determinations of position that must not be overlooked: they are affected by any abnormalities in the direction of the vertical, of which we have spoken above. Owing partly to the attraction of visible masses above the sea level, but often much more to invisible excesses or defects of density below, the direction of gravity is displaced from the normal to the theoretical figure of revolution which is the "figure of the earth" to which all survey calculations are referred. In consequence of such abnormalities, the distance between two stations determined astronomically from their latitudes and longitudes will not agree very closely with the distance determined by the ordinary survey methods of base measurement and triangulation. In very mountainous regions the differences thus created between the two classes of measures, the geodetic and the astronomical, may amount to a considerable part of a minute of arc, or nautical mile; and a single astronomical point may be very visibly out of accordance with surrounding points determined by triangulation. Such discordances would play havoc with a large-scale cadastral survey, in which areas are all-important, and nothing can replace triangulation for work of this type. On the other hand, astronomical determinations are often easy just where triangulation is practically impossible, as in flat deserts. Hence we shall have inevitable discordances where the triangulation meets the desert survey by astronomical positions that wireless has so much improved. But this discordance is not all loss, for the information thus obtained will be essential in a general discussion of the abstruse problems of the real shape of the level surface, which are of the greatest scientific interest, though, perhaps, of not much practical importance at present.

So much for the use of time signals in land survey of the large scale. Their use in navigation has become a commonplace, and they must have done much to relieve the strain on the supply of chronometers caused by the great expansion of our Navy during the war, added to the serious destruction both in naval actions and in the sinking of merchant ships. As to the use of directional wireless in hydrographic surveys, it has a serious competitor in submarine sound ranging, and we may suspect that the latter, about which scarcely anything has been published, is the more accurate at present. There is, however, this consolation for the wireless enthusiast, that sound, with its insignificant speed of five seconds for a mile in air, and one second in water, is much more readily delayed or destroyed by local circumstance than is the almost infinitely rapid wireless wave, to which the future assuredly belongs.

A natural corollary of the extension of time signals is the use of "standard time" afloat, as well as on shore. But the introduction of

this reform was not made in the Navy without some hesitation, and will not be wholeheartedly adopted in the mercantile marine without some persuasion. We shall find it worth while, therefore, to give some space this year to the examination of a matter which is not quite so simple as it appears on the surface, and is of very great importance to the future of wireless intercommunication. The credit of the first effective move belongs to the distinguished hydrographer of the French Navy, Monsieur J. Renaud, who has published in the *Annuaire* of the *Bureau des Longitudes* for 1918 an excellent summary of the reasons which led to the employment of standard time in the French and Italian navies, and thus to the British Hydrographer's Conference of 1917.

"Although," says M. Renaud, "the ocean covers nearly three-quarters of the surface of the globe, the question of time has almost always been treated without reference to the life of the seafarer." Nearly all civilised countries have fixed by law the time shown on their public clocks, but the International Time Conference, which met at Paris in October, 1912, gave no attention at all to the question of the time at sea. Yet precise knowledge of the time of events recorded at sea is important, whether in public business or in scientific affairs, especially in meteorology. On land we have arrived by gradual steps, first, at the use of mean time instead of apparent solar time; then at the use of one uniform mean time throughout a country; and, finally, at the use in most countries of "standard time," based on that of the meridian of Greenwich, and differing from Greenwich mean time by an exact number of hours, with the ultimate intent that all clocks throughout the land surface of the world shall show the same minutes and seconds, and differ only in the hours. Meanwhile the sailor has continued in the primitive condition of keeping local apparent time, more or less, putting the ship's clock to this at noon, and keeping it to this setting until the next noon, though all the time the longitude is changing. Such was the rule, but by no means always the practice. Cross-channel services, or vessels on coasting voyages, would often keep the time of the shore; transatlantic passenger ships would make the large corrections needed in several parts each day, according to the captain's view of the convenience of his passengers or the requirements of the ship's routine. As the time was continually changing with the change of longitude, there was no particular inducement to keep it very accurately; and it is important to notice that the noon observation at sea gives the latitude, but not the time, except very roughly; and the instant of local noon is derived from the morning observation for time and longitude, combined with the dead reckoning of the ship.

It resulted from this process that the exact time of an event at sea could rarely be ascertained. It was recorded in hours and minutes of the ship's clock, with the position of the ship at the time, which data are insufficient. To convert the record into G.M.T. one must know either the longitude of the ship at noon when the clock was last adjusted, or the time at the place of record; and after the event these data were usually unobtainable. Moreover, there were many occasions in which this vagueness of time was inconvenient in the actual working of the ship: when, for example, it was required to take out from the Tide Tables the data required for entering port. Still more inconvenient was it when signals were made from ship to ship,

especially when two fast ships going east and west passed in the north Atlantic; and the great increase of intercommunication by wireless was the decisive factor in putting an end to all this uncertainty and risk of error.

The obvious reform was to introduce at sea the system of standard time, varying by exact hours from Greenwich Mean Time. This system is commonly, but unfortunately, known as "Zone Time": unfortunately, because a zone is the area included between two parallels of latitude, not that between two meridians of longitude. The French have an excellent word, "*fuseau*," meaning spindle, for such an area, and divide the world into "*fuseaux horaires*." We can avoid the word zone in speaking of Standard Time; but have nothing for it but to speak of an hour zone when we wish to describe the area in which one uniform hour is kept. The theory of hour zones is very simple. If Greenwich is to be the prime meridian, as is now universal, the zone of Greenwich time, or the zero zone, is bounded by the meridians $7\frac{1}{2}^{\circ}$ east and west of Greenwich; the zone of time one hour slow on Greenwich is included between the meridians $7\frac{1}{2}^{\circ}$ and $22\frac{1}{2}^{\circ}$ west, and so on round the world. In practice one modifies the zones a little as they approach the coasts, so as to conform to the standard times kept ashore, which sometimes for convenience, exceed the strict limits of the zones, as in the north of Norway, where the time of central Europe is kept, one hour fast of Greenwich, though the longitude is nearly 30° east. The French Hydrographer published an excellent *Planisphère des Fuseaux horaires* to show the limits of these zones of convenience, and they have since been adopted without change by the British, on the recommendation of the British Hydrographer's Conference in 1917.

But in one respect the British have found themselves obliged to differ from the French: in numbering the zones. The French number the hour zones eastward from 0 to 23. To find the Greenwich Mean Time corresponding to the standard time of Zone 8 one subtracts 8 hours; but in Zone 22 one must obviously add 24 hours before performing the subtraction, or the result will be a whole day wrong. Herein lies the one defect of the French system: it is not easy to provide for it giving infallibly the right day. The Zone 12 is divided into two parts by the 180th meridian, where the date should theoretically change; but in practice it has been found convenient to draw a "Date-line," which in places deviates considerably from this meridian. Through Bering Strait it is about 40 minutes of time east of the meridian, to preserve a uniform date for all Asia; and a little to the south it is nearly as much west, to keep the American date for the Aleutian Islands. South of the Equator it diverges half an hour east, to bring Fiji and Chatham Island within the region of the Old World date; and now that Samoa is to go under mandate to New Zealand, the line will presumably be altered, or Samoa will be a day behind her mandatory power.

The French method of numbering the zones did not, therefore, commend itself to the British conference; which was of the opinion that the description of the zone should give the actual correction required to reduce the Zone Time to Greenwich Mean Time *and date*. It was therefore resolved that the zones west of the zero zone should be described as Plus 1, Plus 2, up to Plus 12 for that part of Zone 12 lying east of the date-line (that is, the line described in the Admiralty

Sailing Directions based on the 180th meridian, on crossing which, from east or west, the date must be advanced or put back one day respectively; and that the zones east of the zero zone should be described as Minus 1, Minus 2, up to Minus 12 for that part of Zone 12 lying west of the date-line. By this simple improvement—with which, we are glad to know, Monsieur Renaud is personally in sympathy—the complexity of the date-line change is removed, and Zone Time can be referred infallibly to G.M.T.

It is important to note that the Zone Time kept at any moment by a ship is not necessarily the time of the zone in which she actually is. The change of the ship's clock must be a whole hour, and it will depend on circumstances when this change can most conveniently be made with regard for the ship's routine. Further, a ship may be keeping summer time (though the Conference expressed the opinion that there is no advantage in doing so at sea), and in that case the zone description will be one less than the true number of the zone. The whole essence of the reform is that the time shall differ a whole number of hours from G.M.T., and that the correction to reduce it to G.M.T.—that is, the zone description—shall be recorded with the time. If that is done, it matters nothing to the accuracy of the record whether a ship is keeping the time of the zone in which she actually is or that of any other zone which may be convenient.

The Conference recommended, further, that Zone Time should be used for the immediate future in registering the receipt and dispatch of all wireless telegraph, telegraph, and visual messages; but was nevertheless of opinion that the most convenient time to adopt for all records of and reference to time in all messages throughout the world would be Greenwich Mean Time, and expressed the hope that this proposal might as soon as possible be brought before the various nations and bodies concerned.

During the continuance of the war special rules were in force for time-keeping in the Navy; but in the spring of last year an Admiralty order was issued which brought into use the system described above. The Marine Department of the Board of Trade had already, a year before, prepared the way for its introduction into the mercantile service by the issue of their Memorandum on Time-keeping at Sea, accompanied by a Time Zone Chart; and there is every reason to hope that in the course of a few months the new system will be universal in the British service. To neglect it would be to throw away wilfully a great part of the convenience that might otherwise be gained by the rapid development of wireless time services throughout the world.

There remains the task of persuading recalcitrant people ashore to follow the lead now given them by the sea. It is no credit to the British Empire that Newfoundland, British Guiana, and British East Africa should be coloured yellow on the Time Zone Chart, along with Abyssinia and Arabia and other backward countries. Nor is it very satisfactory to find Nigeria, British India, other than Calcutta (which is yellow), South Australia, and New Zealand coloured purple, to show their half-hearted adoption of standard times involving odd half-hours. However much one may dislike the principle of "daylight saving," it may at least be used as an argument against those who spoil the beauty of the system by insisting on the odd half-hours.

INTERNATIONAL TIME AND WEATHER SIGNALS.

CURRENT ARRANGEMENTS.

BELOW are given particulars of the time and weather messages issued in different countries. Changes are in progress in the weather messages and the codes in which they are issued, but the following explanatory notes and specifications apply to the majority of those issued at present. The standard group is represented symbolically by

BBBDD FWS

Here BBB = barometer reduced to sea-level and corrected for gravity. If the barometer reading is given in inches, the initial 2 or 3 is usually omitted and the values given to the nearest hundredth. If it is expressed in millimetres and tenths, the initial 7 is omitted. If it is expressed in millibars and tenths the initial 9 or 10 is omitted.

Readings in millimetres can be expressed in millibars by adding $\frac{1}{3}$ —*e.g.*,
 $760 \text{ mm.} = 760 + \frac{1}{3} (760) = 760 + 253\cdot3 = 1013\cdot3 \text{ mb.}$

Similarly, readings in millibars can be expressed in millimetres by taking $\frac{3}{4}$ of the value—*e.g.*, $1,000 \text{ mb.} = \frac{3}{4} (1000) = 750 \text{ mm.}$

DD = direction of wind according to the following code unless otherwise specified :—

02 = N.N.E.	18 = S.S.W.
04 = N.E.	20 = S.W.
06 = E.N.E.	22 = W.S.W.
08 = E.	24 = W.
10 = E.S.E.	26 = W.N.W.
12 = S.E.	28 = N.W.
14 = S.S.E.	30 = N.N.W.
16 = S.	32 = N.

For calm the figures 00 are used.

F = Force of wind on Beaufort scale specified on pp. 1048 and 1049.

For forces greater than 9 a special note is usually added at the end of a message.

W = Weather by following code :—

- 0 = fine, cloudless.
- 1 = less than half sky covered with cloud.
- 2 = about half sky covered with cloud.
- 3 = about three-quarters of sky covered with cloud.
- 4 = overcast.
- 5 = rain.
- 6 = snow.
- 7 = mist (not *wet fog*, but fog less thick than for 8).
- 8 = fog.
- 9 = thunderstorm.

S = state of the surface of the sea :—

- 0 = calm—glassy.
- 1 = very smooth—slightly rippled.
- 2 = smooth—rippled.
- 3 = slight—rocks buoy.
- 4 = moderate—furrowed—choppy.
- 5 = rather rough—much furrowed.
- 6 = rough—deeply furrowed.
- 7 = high—rollers with steep fronts.
- 8 = very high—rollers with steep fronts.
- 9 = phenomenal—precipitous.

Fuller reports include also the temperature TT, the barometric characteristic c and the tendency bb. A conversion table from degrees Absolute to degrees Fahrenheit and *vice versa* is given in Table I. Degrees Centigrade are obtained from degrees Absolute by subtracting 273.

For reports of visibility V the following is the standard telegraphic code :—
Code figure.

0	=	objects not visible at 50 metres.			
1	=	objects visible at 50 metres but not at 200 metres.			
2	=	" " 200 " " 500 "			
3	=	" " 500 " " 1,000 "			
4	=	" " 1,000 " " 2,000 "			
5	=	" " 2,000 " " 4,000 "			
6	=	" " 4,000 " " 7,000 "			
7	=	" " 7,000 " " 12,000 "			
8	=	" " 12,000 " " 30,000 "			
9	=	" " 30,000 and exceptionally clear air.			

For reports of barometric tendency the characteristic c has the following significance for the period of 3 hours preceding the time of observation :—

	<i>Old Scale.</i>	<i>New Scale.</i>
0	= barometer steady.	steady or rising.
1	= " unsteady.	rising, then steady.
2	= " rising continuously.	rising, then falling.
3	= " falling continuously.	falling or steady, then rising.
4	= " falling, then rising.	unsteady, but rising.
5	= " steady, then rising.	falling.
6	= " steady, then falling.	falling, then steady.
7	= " falling, then steady.	falling, then rising.
8	= " rising, then steady	steady or rising, then falling.
	or falling	
9	= " sudden rise with marked change of wind and weather.	unsteady, but falling.

In the new scale the first five figures are used if the barometer has on the whole risen in the last three hours.

The amount of change or tendency b is expressed in $\frac{1}{4}$ millibars in British reports, in half millimetres where millimetres are used for barometer. [For negative values of the tendency 50 used to be added to the actual numerical value of bb; where millimetres were used negative values used to be indicated by adding 50 to the wind direction DD.]

For reports of humidity H the following scale is used :—

0	= 95 — 100 per cent.	5	= 50 — 59 per cent.
9	= 90 — 94 "	4	= 40 — 49 "
8	= 80 — 89 "	3	= 30 — 39 "
7	= 70 — 79 "	2	= 20 — 29 "
6	= 60 — 69 "	1	= 10 — 19 "

TABLE SHOWING THE SCALE FOR PRESENT WEATHER (ww).

	0	1	2	3	4	5	6	7	8	9
0	bc—	bc	bc+	bcv	bc⊕	bc/f	bc/r	bc/s	bcrl	bc/tlr
1	co—	co	co+	cov	co	co/f	co/r	co/s	cotl	co/tlr
2	fb	fo	ifb	ifo	fb—	fo—	ffb	ffo	fb+	fo+
3	pr _i	ph _i	prs _i	ps _i	PR—	PR	PR+	PH	PRS	PS
4	d _i	d _i d _i	d _i +	d—	d	dd	d+	D—	D	DD
5	r _i	r _i r _i	r _i +	r—	r	rr	r+	R—	R	RR
6	s _i	s _i s _i	s _i +	s—	s	ss	s+	S—	S	SS
7	rs _i	rs _i rs _i	rs _i +	rs—	rs	rsrs	rs+	RS—	RS	RSRS
8	h _i (r _i)	rh _i rh _i	h _i (r _i)+	h(r)—	h(r)	rh rh	h(r)+	H(R)—	H(R)	RHRH
9	tlr _i	tlrh _i	tlr	tlrh	TLR	TLRH	TLR 	TLRH 	kQ	kQh

A "solidus" means that the weather denoted by the letters preceding it is the actual weather at the time, and that it followed conditions denoted by the letter or letters after the "solidus." Thus, bc/r means "fair weather after rain."

In the table the Beaufort letters have their usual significance, but a suffix _i means "slight," and a capital means "heavy"; i=intermittent. A letter repeated denotes continuity: r_is_i=slight sleet; RR=continuous heavy rain; kQ=line squall (i.e., very heavy squalls, with change of wind direction and fall of temperature).

TABLE SHOWING THE SCALE FOR PAST WEATHER (WW).

	0	1	2	3	4	5	6	7	8	9
0	b	bc(H)	bc(L)	bc(LH)	c(H)	c(L)	c(LH)	co(H)	co(L)	co(LH)
1	o(H)	o(L)	o(LH)	O(LH)	bo(LH)	oif	o2f	o3f	o4,5f	o,6,7,8f
2	1f	2f	3f	4f,5f	6,7,8f	1fe	2fe	3fe	4,5fe	6,7,8fe
3	e	v	z	w	x	V	~		⊕	⊞
4	⊙	⊙		q		g	u	t	l	tl

8	r _i s _i	rr	RR	r _i s _i h _i	rrh	RRH	r _i s _i r _i s _i	rsrs	RSRS	s _i s _i
9	ss	SS	tlr _i	tlr	TLR	tlrh _i	tlrh	TLRH	Line Q	—

In the table a letter repeated denotes continuity. Thus: rr=continuous rain, while r=rain at times; r_is_ir_is_i=continuous slight sleet.

The letters in brackets (L) and (H) refer to the type of cloud. Thus: c(H) means cloudy with medium or high cloud; c(L) means cloudy with low cloud; c(LH) means cloudy with mixed cloud.

The scale for cloud form is as follows:—

- | | |
|--------------------|--------------------------------|
| 1 = Cirrus. | 6 = Strato-cumulus. |
| 2 = Cirro-stratus. | 7 = Nimbus. |
| 3 = Cirro-cumulus. | 8 = Cumulus or fracto-cumulus. |
| 4 = Alto-cumulus. | 9 = Cumulo-nimbus. |
| 5 = Alto-stratus. | 0 = Stratus. |

The Fog Scale is as follows:—

- | | |
|-------------------------------------|--------------------------------------|
| 8f=objects not visible at 25 yards. | 4f=objects not visible at 500 yards. |
| 7f= " " " 50 " | 3f= " " " 2,000 " |
| 6f= " " " 100 " | 2f= " " " 4 miles. |
| 5f= " " " 200 " | 1f= " " " 12 " |

SPECIFICATION OF THE BEAUFORT SCALE WITH

Beaufort Number.	Admiral Beaufort's General Description of Wind.	Admiral Beaufort's Specification, 1805.	Description of Wind.	Mode of Estimating aboard Sailing Vessels.		
0	Calm	Calm	—	—		
1	Light air ..	Just sufficient to give steerage way.	Light breeze	Sufficient wind for working ship.		
2	Slight breeze	That in which a well-conditioned man-of-war, with all sail set and "clean full," would go in smooth water from			Moderate breeze	Forces most advantageous for sailing with leading wind and all sail drawing.
3	Gentle breeze					
4	Moderate breeze	3 to 4 knots.	Moderate breeze	Forces most advantageous for sailing with leading wind and all sail drawing.		
5	Fresh breeze	5 to 6 knots.				
6	Strong breeze	Royals, etc.	Strong wind	Reduction of sail necessary with leading wind.		
7	Moderate gale (<i>High Wind</i>)	Single-reefed topsails or top-gallant sails.				
8	Fresh gale .. (<i>Gale</i>)	Double-reefed topsails, jib, etc.				
9	Strong gale ..	Triple-reefed topsails, etc.	Gale forces	Considerable reduction of sail necessary even with wind quartering.		
10	Whole gale ..	Close-reefed topsails and courses.				
11	Storm ..	That with which she could just carry in chase "full and by."	Storm forces	Close reefed sail running, or hove to under storm sail.		
12	Hurricane ..	That which would reduce her to storm stay-sails.				
		That which no canvas could withstand.	Hurricane ..	No sail can stand even when running.		

* It has been decided that for statistical purposes winds of force less than 8 shall not be counted as gales, and to avoid the ambiguity implied by the use of the term "moderate gale" for force 7 the Beaufort description has been modified by the substitution of the descriptions in italics for forces 7 and 8.

EQUIVALENTS OF THE NUMBERS OF THE SCALE.

Beaufort Number.	Specification of Beaufort Scale.		Mean wind force in lb. per sq. ft. at standard density.	Equivalent velocity in miles per hour.	Limits of Velocity.
	For Coast Use.	For Use on Land.			
0	Calm	Calm; smoke rises vertically.	0	0	Less than 1
1	Fishing smack * just has steerage way.	Direction of wind shown by smoke drift, but not by wind vanes.	·01	2	1-3
2	Wind fills the sails of smacks, which then move at about 1-2 miles per hour.	Wind felt on face; leaves rustle; ordinary vane moved by wind.	·03	5	4-7
3	Smacks begin to careen, and travel about 3-4 miles per hour.	Leaves and small twigs in constant motion; wind extends light flag.	·28	10	8-12
4	Good working breeze; smacks carry all canvas, with good list.	Raises dust and loose paper; small branches are moved.	·67	15	12-18
5	Smacks shorten sail . .	Small trees in leaf begin to sway; crested wavelets form on inland waters.	1·31	21	19-24
6	Smacks have double reef in main sail. Care required when fishing.	Large branches in motion; whistling heard in telegraph wires; umbrellas used with difficulty.	2·3	27	25-31
7	Smacks remain in harbour, and those at sea lie to.	Whole trees in motion; inconvenience felt when walking against wind.	3·6	35	32-38
8	All smacks make for harbour, if near.	Breaks twigs off trees; generally impedes progress.	5·4	42	39-46
9	—	Slight structural damage occurs (chimney pots and slates removed).	7·7	50	47-54
10	—	Seldom experienced inland; trees uprooted; considerable structural damage occurs.	10·5	59	55-63
11	—	Very rarely experienced; accompanied by widespread damage.	14·0	68	64-75
12	—	—	Above 17·0	Above 75	Above 75

* The fishing smack in this column may be taken as representing a trawler of average type and trim. For larger or smaller boats and for special circumstances allowance must be made.

TABLE I.—TEMPERATURE. *Degrees Absolute to Degrees Fahrenheit.*
The equations are $A = 273 + \frac{5}{9} (F - 32)$, $F = 32 + \frac{9}{5} (A - 273)$.

30·8	1043·0	1043·3	1043·7	1044·0	1044·3	1044·7	1045·0	1045·4	1045·7	1046·0
30·9	1046·4	1046·7	1047·1	1047·4	1047·7	1048·1	1048·4	1048·7	1049·1	1049·4
31·0	1049·8	1050·1	1050·4	1050·8	1051·1	1051·5	1051·8	1052·1	1052·5	1052·8
31·1	1053·1	1053·5	1053·8	1054·2	1054·5	1054·8	1055·2	1055·5	1055·9	1056·2
31·2	1056·5	1056·9	1057·2	1057·5	1057·9	1058·2	1058·6	1058·9	1059·2	1059·6
31·3	1059·9	1060·3	1060·6	1060·9	1061·3	1061·6	1062·0	1062·3	1062·6	1063·0
31·4	1063·3	1063·6	1064·0	1064·3	1064·7	1065·0	1065·3	1065·7	1066·0	1066·4

Thousandths of an Inch.

Inch	·001	·002	·003	·004	·005	·006	·007	·008	·009
Millibars.	·0	·1	·1	·1	·2	·2	·2	·3	·3

For brevity, the fundamental equations may be written:—

$$g_{45} = 980 \cdot 617 \text{ c.m./sec}^2,$$

density of mercury at normal freezing-point of water = 13·5955

1 mercury-inch = 33·8632 millibars, 1 mercury millimetre = 1·33320 millibars.

1000 millibars = 1 bar = 29·5306 mercury-inches = 750·076 mercury millimetres, using

1 inch = 2·54000 cm.

TABLE II (A).

Relation between inches and millimetres for comparison of readings of barometers graduated in these units.

In.	Mm.	In.	Mm.	In.	Mm.	In.	Mm.
27.0	685.8	28.0	711.2	29.0	736.6	30.0	762.0
27.2	690.9	28.2	716.3	29.2	741.7	30.2	767.1
27.4	696.0	28.4	721.4	29.4	746.8	30.4	772.2
27.6	701.0	28.6	726.4	29.6	751.8	30.6	777.2
27.8	706.1	28.8	731.5	29.8	756.9	30.8	782.3

NOTE.—(1) The table is based on the legal relation 1 in. = 2.5400 cm., which agrees very closely indeed with the best experimental comparisons.

(2) As millimetre barometers have the same standard temperature 0° C. for the brass scale and for the mercury, while inch barometers have a standard 32° F. for the mercury and 60° F. for the brass scale, the readings require correction for temperature by appropriate tables before the comparison can be made.

ARGENTINA

The Naval Observatory at Darsena Norte, situated on the northern entrance to the Port of Buenos Ayres, sends out, through the radio station located there, signals once daily at 10 p.m. (0200 G.M.T.) (Sundays and holidays excepted), on a wavelength of 800 metres. Their method of transmission consists of the sending of a series of five groups of dashes with a dot at each minute.

The method of transmission is as follows:—

- (a) from 1.55'.00" to 1.55'.50" (Greenwich a.m. mean time) a warning signal consisting of an unbroken series of dashes;
- at 1.56'.00" a dot representing the 1st time-signal.
- (b) from 1.56'.15" to 1.56'.50" an unbroken series of dashes;
- at 1.57'.00" a dot representing the 2nd time-signal.
- (c) from 1.57'.20" to 1.57'.50" an unbroken series of dashes;
- at 1.58'.00" a dot representing the 3rd time-signal.
- (d) from 1.58'.25" to 1.58'.50" an unbroken series of dashes;
- at 1.59'.00" a dot representing the 4th time-signal.
- (e) from 1.59'.30" to 1.59'.50" an unbroken series of dashes;
- at 2.00'.00" a dot representing the 5th and last time-signal.

Time-Signals.

	1st	2nd	3rd	4th	5th	Greenwich time.
1st	1.56'.00"
2nd	1.57'.00"
3rd	1.58'.00"
4th	1.59'.00"
5th	2.00'.00"

Duration of dot = $\frac{1}{4}$ second.

International Time and Weather Signals

AUSTRALASIA

Time signals are transmitted by the following stations:—
Adelaide Radio .. At 12.30 a.m. and p.m. Melbourne Time (1430 G.M.T.), international time-signals Wavelength 600.

Melbourne Radio .. At noon and midnight (Sundays excepted) standard time (0157-0200 and 1357-1400) international time-signals being used. 600 m.

Perth Radio .. At 9 a.m. and p.m. on 600 metres wavelength (2300 and 1100 G.M.T.). Wavelength 600 metres.

Ocean forecasts are transmitted by the following stations at specified (Melbourne time):—

Perth, 11 p.m. (1300 G.M.T.).

Adelaide, 9.30 p.m. (1130 G.M.T.).

Brisbane, 10 p.m. (1200 G.M.T.).

Melbourne, 9 p.m. (1100 G.M.T.).

Sydney, 8.30 a.m. and p.m. (2230 and 1030 G.M.T.).

Other stations repeat as necessary.

At present an official Ocean Forecast is transmitted daily Central Weather Bureau, Melbourne, to all Radio Stations in Australia, Port Moresby (New Guinea), and it is preceded by a specific statement of sea conditions existing at 9 a.m. around Australia, and sea disturbances any part of the coast. This information can be obtained by vessel request. When weather conditions are severe storm warnings are broadcast by the Shore Stations, and vessels receiving the warning requested to communicate them to passing shipping by means of code.

Each of the principal radio stations is supplied with a barometer for the purpose of giving information, so that if a shipmaster desires he may by asking the operator in charge. Daily weather reports (barometer state of wind, weather and sea) are received at the Meteorological Bureau, Melbourne, from shipmasters whenever their vessels are in Australian waters.

The restrictions which were placed on wireless messages during the resumption of radio weather reports from ships when 300 miles or more from the Australian coastline—many messages are now being received.

NEW ZEALAND

New Zealand stations send out weather forecasts on 600-metre length, Mondays to Fridays, inclusive, as follows:—

Radio Awarua ..	8.30 p.m.
Radio Wellington ..	9 p.m.
Radio Awanui ..	10 p.m.

The above are New Zealand mean time—1½ hours ahead of G.M.T. The forecast is not sent out on Saturday or Sunday unless the conditions are exceptional.

PROVISIONAL WIRELESS TIME SERVICE.
It is notified for general information that arrangements have been made for a provisional wireless time service from the standard mean time of the Hector Observatory, Wellington, New Zealand. This service begins on— (see Note below).
The time signals are transmitted by the Wellington Radio Station on a wavelength of 600 metres; the sending key at 400 cycles per second, automatically operated by the observatory.

AUSTRALASIA

Time signals are transmitted by the following stations :—

- Adelaide Radio .. At 12.30 a.m. and p.m. Melbourne Time (0230 and 1430 G.M.T.), international time-signals being used. Wavelength 600.
- Melbourne Radio .. At noon and midnight (Sundays excepted), Victorian standard time (0157-0200 and 1357-1400 G.M.T.), international time-signals being used. Wavelength 600 m.
- Perth Radio .. At 9 a.m. and p.m. on 600 metres wavelength, Melbourne Time (2300 and 1100 G.M.T.). Wavelength 600 metres.

Ocean forecasts are transmitted by the following stations at the hours specified (Melbourne time) :—

- Perth, 11 p.m. (1300 G.M.T.).
 Adelaide, 9.30 p.m. (1130 G.M.T.).
 Brisbane, 10 p.m. (1200 G.M.T.).
 Melbourne, 9 p.m. (1100 G.M.T.).
 Sydney, 8.30 a.m. and p.m. (2230 and 1030 G.M.T.).

Other stations repeat as necessary.

At present an official Ocean Forecast is transmitted daily from the Central Weather Bureau, Melbourne, to all Radio Stations in Australia, also Port Moresby (New Guinea), and it is preceded by a specific statement of sea conditions existing at 9 a.m. around Australia, and sea disturbances off any part of the coast. This information can be obtained by vessels upon request. When weather conditions are severe storm warnings are sent out broadcast by the Shore Stations, and vessels receiving the warnings are requested to communicate them to passing shipping by means of code flags.

Each of the principal radio stations is supplied with a barometer for the purpose of giving information, so that if a shipmaster desires he may obtain the barometer reading, also wind and weather conditions at a radio station, by asking the operator in charge. Daily weather reports (barometer readings, state of wind, weather and sea) are received at the Meteorological Bureau, Melbourne, from shipmasters whenever their vessels are in Australian waters.

The restrictions which were placed on wireless messages during the war have now been removed, and steps have been taken to bring about the resumption of radio weather reports from ships when 300 miles or more from the Australian coastline—many messages are now being received.

NEW ZEALAND

New Zealand stations send out weather forecasts on 600-metre wavelength, Mondays to Fridays, inclusive, as follows :—

- Radio Awarua 8.30 p.m.
 Radio Wellington 9 p.m.
 Radio Awanui 10 p.m.

The above are New Zealand mean time—11½ hours ahead of G.M.T.

The forecast is not sent out on Saturday or Sunday unless the conditions are exceptional.

PROVISIONAL WIRELESS TIME SERVICE.

It is notified for general information that arrangements have been made for a provisional wireless time service from the standard mean time clock of the Hector Observatory, Wellington, New Zealand. This service will begin on——— (see Note below).

The time signals are transmitted by the Wellington Radio Station on a wavelength of 600 metres; the sending key at the radio station being automatically operated by the observatory clock.

The time signal begins at 21 hours 0 minutes 0 seconds Greenwich Mean Time (8 hours 30 minutes p.m. New Zealand Time), and is repeated on the 1st, 2nd, 4th, and 5th minutes.

Each time signal begins exactly at the beginning of the minute and lasts for one second approximately.

In addition to the automatic time signals other signals are transmitted by hand, but they must NOT be used as time signals.

The signals are transmitted in the following manner:—

Greenwich Mean Time.

<i>h.</i>	<i>m.</i>	<i>s.</i>	<i>h.</i>	<i>m.</i>	<i>s.</i>	
20	58	00	to	20	59	05
New Zealand Observatory Time Signals						
twenty-one hours Greenwich Mean Time.						
New Zealand Observatory Time Signals						
twenty-one hours Greenwich Mean Time.						
20	59	15	to	20	59	45
Time Signal.						
21	00	00	to	21	00	01
Time Signal.						
21	00	15	to	21	00	45
Time Signal.						
21	01	00	to	21	01	01
Time Signal.						
21	01	15	to	21	01	45
Time Signal.						
21	02	00	to	21	02	01
Time Signal.						
21	02	15	to	21	03	45
Time Signal.						
21	04	00	to	21	04	01
Time Signal.						
21	04	15	to	21	04	45
Time Signal.						
21	05	00	to	21	05	01
Time Signal.						

The Greenwich Mean Times that the Wireless Time Signals begin at, and the corresponding New Zealand Times are:—

		<i>h.</i>	<i>m.</i>	<i>s.</i>		<i>h.</i>	<i>m.</i>	<i>s.</i>
1st	Time Signal	..	21	00	00	..	8	30
2nd	"	..	21	01	00	..	8	31
3rd	"	..	21	02	00	..	8	32
4th	"	..	21	04	00	..	8	34
5th	"	..	21	05	00	..	8	35

There is no time signal at 21 hours 03 minutes 00 seconds.

The provisional wireless time service will be in operation on Tuesdays and Fridays, provided satisfactory observations have been obtained. The wireless time service will be suspended when owing to bad weather or other causes it is not possible to supply accurate time signals.

N.B.—The date at which this service should begin is left open until the fate of the New Zealand Standard Time Bill is decided by Parliament, because if the Standard Time Bill is passed all New Zealand Mean Times quoted in the notice would have to be increased by 30 minutes.

GENERAL CONDITIONS, AUSTRALIA AND NEW ZEALAND.

Any request for information must be addressed to the Coast Station in the form of a Service message signed by the Commander or responsible officer deputed by him. Information regarding weather should not be asked for during hours of darkness, but should be listened for at the regular transmission periods. Providing, however, that there is no jamming, permission is granted for ships to call up shore stations during the daylight hours to obtain weather reports.

BELGIUM

Hourly Meteorological Reports are issued daily from Brussels (HS) on a wavelength of 1400 m. at 25 minutes past each hour from 0625 to 1625, in exactly the same code as that used for hourly reports in Great Britain (q.v.). The reports refer to Brussels and Ostend.

A report for Brussels in standard code for synoptic reports is also issued at 0715, 1315, 1815 G.M.T.

International Time and Weather Signals

BELGIAN CONGO

Three of the stations in this territory, viz.: Kinshasa, and Elizabethville, have been organised to deal with time follows:—

- (1) Daily reception of time signals from Lyons Station (F)
- (2) Emission of an approximate time signal to stations with

BOLIVIA

In this republic an important meteorological service is carried out by the auxiliary of the telegraphs. Father Tortoso, Director of the A Observatory of the San Calisto College, collects and collates a number of covering his district. The Marconi Wireless Telegraph Station possesses also an annexe wherein are installed instruments for the Small meteorological installations also exist in Tarija, Villa Monte and Copacabana, whilst others are projected in Cuatro Ojos Suarez.

BRAZIL

The Naval Radio Station at Ilha do Governador transmits a series of time signals, planned in accordance with the International Convention, and transmitted on a wavelength of 1,800 metres. These signals are at 10 hours 55 minutes 0 seconds, and at 20 hours 55 minutes 0 seconds de Janeiro time (1357-1400 and 2357-2400 G.M.T.), and follow the procedure as that detailed below under "France, Eiffel Tower." Like signals, the Brazilian series is introduced by the letter O (— — —) Morse alphabet, and the authorities notify us that these introduced which finish at 10 hours 56 minutes 20 seconds, "are for the special observatory, and, therefore, it may be decided at any time to discontinue them." They also state that in case of "an accident preventing mission for correct reception of the signals either at 11 or 21 o'clock signals will be repeated in each case half an hour later at 27-30 instead of 57-60 minutes."

After the time signals issued at 21 o'clock, meteorological and signals are issued in accordance with the rules of the Paris Convention issued:—

The following is the code in which the meteorological reports are issued:—

Station Call Letters, BBBDDFFWS.
Example: SL 567021141 FT 567020 XX RF, etc.

The station letters are as follows:—

MX = Mandoos.	VT = Victoria.	FP = Florianopolis.
BL = Belem.	CF = Cabo Frio.	RG = Rio Grande.
SL = S. Luiz.	RJ = Rio Janeiro.	PA = Porto Alegre.
FT = Fortaleza.	SP = S. Paulo.	CB = Curitiba.
RF = Recife.	ST = Santos.	MV = Montevideo.
BH = Bahia.	PG = Paranaguá.	BA = Buenos Aires.

BRITISH HONDURAS

Weather reports are sent out daily by the station at Belize from to November inclusive at 1140 and 2400 G.M.T. Wavelength 1,000

BULGARIA

Meteorological reports are issued three times daily on a wavelength of 3,800 metres at 0530, 0900, 1300.

BELGIAN CONGO

Three of the stations in this territory, viz.: Kinshasa, Stanleyville and Elizabethville, have been organised to deal with time signals as follows:—

- (1) Daily reception of time signals from Lyons Station (France).
- (2) Emission of an approximate time signal to stations within range.

BOLIVIA

In this republic an important meteorological service is carried on as an auxiliary of the telegraphs. Father Tortoso, Director of the Astronomical Observatory of the San Calixto College, collects and collates a number of data covering his district. The Marconi Wireless Telegraph Station in Viacha possesses also an annexe wherein are installed instruments for this purpose. Small meteorological installations also exist in Tarija, Villa Montes, Ulla-Ulla and Copacabana, whilst others are projected in Cuatro Ojos and Puerto Suarez.

BRAZIL

The Naval Radio Station at Ilha do Governador transmits twice daily a series of time signals, planned in accordance with the International Convention, and transmitted on a wavelength of 1,800 metres. These signals start at 10 hours 55 minutes 0 seconds, and at 20 hours 55 minutes 0 seconds, Rio de Janeiro time (1357-1400 and 2357-2400 G.M.T.), and follow the same procedure as that detailed below under "France, Eiffel Tower." Like the French signals, the Brazilian series is introduced by the letter O (— — —) of the Morse alphabet, and the authorities notify us that these introductory signals, which finish at 10 hours 56 minutes 20 seconds, "are for the special use of the observatory, and, therefore, it may be decided at any time to dispense with them." They also state that in case of "an accident preventing the transmission for correct reception of the signals either at 11 or 21 o'clock, the signals will be repeated in each case half an hour later at 27-30 minutes, instead of 57-60 minutes."

After the time signals issued at 21 o'clock, meteorological and weather signals are issued in accordance with the rules of the Paris Convention of 1912.

The following is the code in which the meteorological reports are issued:—

Station Call Letters, BBBDDFWs.

Example: SL 567021141 FT 567020 XX RF, etc.

The station letters are as follows:—

MN = Manáos.	VT = Victoria.	FP = Florianopolis.
BL = Belem.	CF = Cabo Frio.	RG = Rio Grande.
SL = S. Luiz.	RJ = Rio Janeiro	PA = Porto Alegre.
FT = Fortaleza.	SP = S. Paulo.	CB = Corumbá.
RF = Recife.	ST = Santos.	MV = Montevideo.
BH = Bahia.	PG = Paranaguá.	BA = Buenos Ayres.

BRITISH HONDURAS

Weather reports are sent out daily by the station at Belize from June to November inclusive at 1140 and 2400 G.M.T. Wavelength 1,000 metres.

BULGARIA

Meteorological reports are issued three times daily from Sofia (FF) on a wavelength of 3,800 metres at 0530, 0900, 1,545 G.M.T. (?)

CANADA AND NEWFOUNDLAND

A time signal is sent out by the Camperdown Station daily at 2 p.m. (G.M.T.) on a wavelength of 600 metres.

The Barrington Passage Station sends out messages *re* ice, weather and danger to navigation at 0130, 1330 G.M.T. on a wavelength of 1,600 metres.

The stations of Alert Bay, B.C., Belle Isle, Camperdown, N.S., Cape Bear, Cape Lazo, Cape Race, Cape Ray, Cape Sable, Clarke City, Dead Tree Point, Digby Island, Estevan, B.C., Fame Point, Father Point, Gonzales Hill, Grindstone Island, Grosse Isle (Quebec), Harrington, Heath Point, Ikeda Head, Kingston (Ontario), Midland (Ontario), Montreal, North Sydney, N.S., Pachena, Partridge Island, Pictou, N.S., Point Amour, Point Edward, Point Grey, Point Riche, Port Arthur (Ontario), Port Burwell, Quebec, Sable Island, Sault Ste. Marie (Ontario), Three Rivers (Quebec), Tobermory (Ontario), Toronto, and Triangle Island receive weather forecasts from the Canadian Meteorological Service at 10 p.m. These advices will be transmitted free to any ship station on request. In addition, the station transmits, without coast charge, radiotelegrams of the following kinds:—

1. Any message concerning the navigation of a vessel sent by the captain of the vessel and intended for any department of the Government, any officer of the Government, or the officer in charge of the coast station.

2. Messages exchanged between the captain of any vessel and any person whatsoever concerning the state of the weather, the condition of the tide or ice, or reports on aids to navigation.

CANARY ISLANDS

A meteorological report from the Izana Observatory on the Pico do Teide is sent daily by Tenerife to Carabanchal (Madrid) at 0905 and 1420 (G.M.T. ?).

CHILE

RADIOTELEGRAPH TIME SIGNAL, TRANSMITTED EVERY NIGHT EXCEPTING SATURDAYS AND SUNDAYS AND HOLIDAYS OF THE OFICINA DE HIDROGRAFIA Y NAVEGACION, VALPARAISO.

Important.—The signals will commence punctually at 12 h. 55 m., Greenwich Mean Time, continuing for exactly five minutes and terminating precisely at 13 h., Greenwich Mean Time (8 h. 12 m., 13° 7' s. to 8 h. 17 m. 13° 7' s., local time).

The Oficina de Hidrografía y Navegación transmits daily the radiotelegraph time signal commencing exactly at 12 h. 55 m., Greenwich Mean Time, and continuing for five minutes. (Length of wave, 600 metres.) During this interval each tick or stroke given by the master chronometer of the Oficina is transmitted by the radiotelegraph wave, excepting the twenty-ninth second of every minute, and the last ten seconds of each one of the five minutes. At the exact termination of the five minutes, which will be 1300 Greenwich time, the cipher which indicates the end of the signal is marked by a long contact, as may be seen exactly from the diagram.

If for any reason there should be an error in transmission, the signal "Senal Nula" (Signal null) will be transmitted, repeated three times at 1301 (G.M.T.)

RADIOTELEGRAPH WEATHER REPORTS TRANSMITTED DAILY BY THE STATION OF VALPARAISO.

¶ The Radiotelegraph Station of Valparaiso transmits daily and with the same length of wave as that with which the time signal is transmitted—viz., 600 metres—the meteorological conditions of certain points on the coast and of the Island of Juan Fernandez.

In order that these signals may be received without difficulty by all vessels, they will be transmitted very slowly.

Except on Sundays and holidays there will be transmitted each day at 12 noon, civil mean time of the meridian $70^{\circ} 41' 34''$ 5 W. (1643 G.M.T. nearly), the meteorological conditions at 8 a.m., and at 9 p.m. (time of the same meridian), those prevailing at 4 p.m., there being added to the last report a résumé containing the variations undergone by the atmospheric factors of the day.

The stations on the coast will be represented by letters of the alphabet, generally by the first letter of their name, and in the following form :—

V = Valparaiso.	J = Juan Fernandez.	R = Raper.
T = Talcahuano.	M = Mocha.	P = Punta Arenas.
C = Corral.	G = Guafo.	

The signal will be sent commencing with the letters O.M.C. (Meteorological Office of Chile). Next will be given the barometric pressure in millimetres at sea-level, but suppressing the figure representing the hundreds ; thus, to indicate a pressure of 753 millimetres, the figure 7 will be suppressed and the number 53 will be transmitted.

Following upon that number 53 will be another numerical figure indicating the direction of the wind. The figures used will be from 1 to 8, as follows : 1 corresponding to N. ; 2, NE ; 3, E ; 4, SE ; 5, S ; 6, SW ; 7, W ; 8, NW.

Lastly will follow another figure indicating the force of the wind, according to the scale of Beaufort ; but when forces above 8 have to be given, they will be signalled in words : nine, ten, eleven and twelve.

In the event of its not being possible to communicate the meteorological conditions at any of the stations, the word " N " will be placed before the representative sign of the station in question, but if it is only a part of the information that cannot be given, that part will be replaced by the letter " X."

If the weather is not good in the ports indicated by the bulletin, there will be added in current language some of the words, such as storm, mist, rain or sun.

In order that this may be better understood, we give below a specimen bulletin :—

O.M.C. V 5534, T 5921, C 5172, M 5765, etc.

which signifies :—

Valparaiso,	barometric pressure	755 mm.,	wind	E,	force	4
Talcahuano	"	"	759 mm.	"	NE	" 1
Corral	"	"	751 mm.	"	W	" 2
Mocha	"	"	757 mm.	"	SW	" 5

CHINA

The Shanghai-Zikawei station receives the time of the 8th time-belt (120° east of Greenwich) from the observatory of Zikawei ; and transmits it on the wavelength of 850 metres according to the following table :—

from	10.53'	to	10.54'	a.m.	preliminary signals.
from	10.54'	to	10.54'.50"	a.m.	a series of " G."
at	10.55'			a.m.	a dot.
from	10.56'	to	10.56'.50"	a.m.	a series of " O."
at	10.57'			a.m.	a dot.
from	10.58'	to	10.58'.50"	a.m.	a series of " X."
at	10.59'			a.m.	a dot.
from	4.53'	to	4.54'	p.m.	preliminary signals.
from	4.54'	to	4.54'.50"	p.m.	a series of " G," etc.
continuing as in the morning.					

These times are 0253-0259 and 0853-0859 (G.M.T.).

The time-signal, morning and evening, is followed immediately by a meteorological telegram.

During the typhoon season, the station transmits, in addition to these periodical messages, useful information on the state of the weather.

No charge is made for the meteorological information.

The Cape d'Aguilar station sends time of Hong-Kong observatory on a wavelength of 1,000 metres at 0356-0400 and 1256-1300 (G.M.T.).

CUBA

The experimental station of de Belen at Havana has been assigned to the reception of meteorological signals. (No further particulars are yet to hand.)

CZECHO-SLOVAKIA

Meteorological reports are issued from Prague (PRG) wavelength 4,100 m. C.W., at 9.20h., 15.45h. and 20.30h. (G.M.T.), giving observations for the following:—

Identification Number	Place	Latitude	Longitude
01	Prague	50° 05'	14° 25'
03	Č. Budějovice (Budweis) .. .	49° 25'	14° 40'
05	Čeb (Eger) .. .	50° 05'	14° 22'
06	Milesovka (Donnersberg), Altitude 840 m.	50° 33'	13° 56'
09	Č. Třebová (Böhm. Trübau) .. .	49° 54'	16° 29'
14	Strážnice .. .	48° 53'	17° 18'
18	Oravský Podzámok (Arvaváralja) .. .	49° 16'	21° 21'
22	Bratislava .. .	48° 09'	17° 07'
23	Stará Ľala (O-Gyalla) .. .	47° 52'	18° 12'
24	Nová Ves (Igló) .. .	48° 56'	20° 33'
26	Užhorod (Ungvár) .. .	48° 36'	22° 18'
28	Prerov (Prerau) .. .	48° 09'	17° 07'

The code used for these reports is:—

At 0920 .. . BBDD FWTTT βbbRR MMmm
At 1545 and 2030 ... BBDD FWTT βbb

DENMARK

WIRELESS METEOROLOGICAL REPORTS.

Transmission station: Lyngby Radio (near Copenhagen).

Continuous waves.

Length of wave: 5,000 metres.

Call signal: OXE.

Normal range: 3,000 km.

Hours of sending 0750 Times of observation 0700 (G.M.T.)

" " 1420 " " 1300
" " 1920 " " 1800

International Time and Weather Signal

OBSERVATION STATIONS AND THEIR CALL SIGNALS

		Position
		Lat. Long.
Copenhagen	0 1	55° 41' 12°
Skagen	0 2	57° 44' 10°
Hanstholm	0 3	57° 7' 8°
Blaavandshuk	0 4	55° 33' 8°
Hammeren	0 5	55° 17' 14°

Each radio telegram begins with the words: meteo danois

The 7 o'clock observations will be transmitted for each station according to the normal international code.

The 13 o'clock and 18 o'clock observations will be transmitted for each station, respectively at 1420 o'clock, BBDD, F and at 1920 o'clock, BBDD, FWTT, Bbb, the letters of which have the same meaning as those above.

The figure indicating the condition of the sea is omitted in relation to Copenhagen.

Observations which are not reported in one message will be at the beginning of the next report by adding the hour of the observation to the station call signal.

Morning radio:— SPECIMEN RADIO TELEGRAMS.

meteo danois 01 65732 41139 00000 2112 02 66152 3
20143 03 68732 24119 00001 16102 05 62528 3
16112.

Following radio at 1420:—
meteo danois 0407 68628 32129 20300 19082 01 6495
02 65952 13182 001 03 67280 42153 312 04 68530
05 60578 53173 316.

In the above morning radio, the Blaavandshuk (04) morning is missing. This morning observation will be found in the 1420 the group 0407 (indicating Blaavandshuk at 7 o'clock).

Besides this, the addition of the call signal of a station at observation will be used to correct a faulty message.

ESTHONIA
Meteorological reports are issued twice daily from Reval (I) wavelength of 1,900 m. (C.W.) at 0840 and 2200 G.M.T., giving observations for 0700 and 1300 and 2100, made at (1) Reval, (2) Dorpat, and (3) stations is adhered to in the messages, but in the evening messages a reports precede the 2100 reports. For the 0700 observations the code BBDD FWTTW¹ bbbRR MMmm

The value of tendency is given in tenths of a millimetre, and so for a falling barometer: 50 is also added to the direction of the this case. For the 1300 and 2100 observations the code used is— BBDD FWTTW¹

Example of an evening message:—
Meteo Esthonie 65232 25122 x x 66728 15141 62316 12035 50
63120 14065
The x x indicate that the midday observations for Reval and Filsand.

the last six groups give the 2100 observations for Reval and Filsand.

OBSERVATION STATIONS AND THEIR CALL SIGNALS.

				Position.	
				Lat.	Long.
Copenhagen	0 1	55° 41'	12° 35'
Skagen	0 2	57° 44'	10° 38'
Hanstholm	0 3	57° 7'	8° 36'
Blaavandshuk	0 4	55° 33'	8° 5'
Hammeren	0 5	55° 17'	14° 46'

Each radio telegram begins with the words : meteo danois.

The 7 o'clock observations will be transmitted for each station in four groups of five figures : BBBDD, FWTTN, BbbRR, MMmms, to be deciphered according to the normal international code.

The 13 o'clock and 18 o'clock observations will be transmitted in three groups for each station, respectively at 1420 o'clock, BBBDD, FWTTs, Bbb, and at 1920 o'clock, BBBDD, FWTT, Bbb, the letters of which are of the same meaning as those above.

The figure indicating the condition of the sea is omitted in the groups relating to Copenhagen.

Observations which are not reported in one message will be transmitted at the beginning of the next report by adding the hour of the missing observation to the station call signal.

SPECIMEN RADIO TELEGRAMS.

Morning radio :—

meteo danois 01 65732 41139 00000 2112 02 66152 34159 30101
20143 03 68732 24119 00001 16102 05 62528 33129 00000
16112.

Following radio at 1420 :—

meteo danois 0407 68628 32129 20300 19082 01 64952 2117 306
02 65952 13182 001 03 67280 42153 312 04 68530 20171 000
05 60578 53173 316.

In the above morning radio, the Blaavandshuk (04) morning observation is missing. This morning observation will be found in the 1420 radio after the group 0407 (indicating Blaavandshuk at 7 o'clock).

Besides this, the addition of the call signal of a station at the time of observation will be used to correct a faulty message.

ESTHONIA

Meteorological reports are issued twice daily from Reval (ELN) on a wavelength of 1,900 m. (C.W.) at 0840 and 2200 G.M.T., giving observations for 0700 and 1300 and 2100, made at (1) Reval, (2) Dorpat, and (3) Filsand.

Each message begins with the words Meteo Esthonie. A fixed order of stations is adhered to in the messages, but in the evening messages *all* the 1300 reports precede the 2100 reports. For the 0700 observations the code used is—

BBBDD FWTTW¹ bbbRR MMmm

The value of tendency is given in tenths of a millimetre, and 500 is added for a falling barometer : 50 is also added to the direction of the wind for this case. For the 1300 and 2100 observations the code used is—

BBBDD FWTTW¹

Example of an evening message :—

Meteo Esthonie 65232 25122 x x 66728 15141 62316 12035 59418 13045
63120 14065

The x x indicate that the midday observations for Dorpat are missing : the last six groups give the 2100 observations at Reval, Dorpat and Filsand.

FRANCE (EIFFEL TOWER, PARIS)

Lat. 48° 51' 41" N. Long. 2° 18' 15" E.

The following arrangements are based on the decisions arrived at by the International Time Conference held in Paris in 1912 modified in accordance with the teachings of experience :—

The radiotelegraph station of the Eiffel Tower transmits each day signals and telegrams of general interest, which are enumerated below :—

" Ordinary time signals " sent out thrice daily : (1) at 10 a.m.,* (2) between 10.44 a.m. and 10.49 a.m.,* and (3) at 11.44 p.m. to 11.49 p.m.*

" Scientific time signals " at 11.30 p.m. preceding the ordinary night time signals, and a correction group (following the ordinary night signals) at 11.50 p.m.

The following transmissions are made regularly from Eiffel Tower, using damped waves :—

<i>G.M.T.</i>	<i>Nature of Signals.</i>						<i>Wavelength.</i>
0245-0255	..	Weather Report	2,500
0815-0825	..	Weather Report	2,500
0956-1000	..	International Time Signals	2,500
1002-1005	..	Sidereal Time Signals	2,500
1044-1049	..	French Time Signals	2,500
1130-1145	..	European Weather Report	2,500
1415-1425	..	Weather Report	2,500
1500-1530	..	Press	3,200
1930-1940	..	Weather Report	2,500
2329-2333	..	Astronomical Time Signals	2,500
2344-2349	..	French Time Signals	2,500
2349-2351	..	Series of Code Figures relating to the Astro- nomical Time Signals	2,500

Press transmission is made at 08.00, 13.00 and 16.30, using continuous waves.

ORDINARY TIME SIGNALS.

According to the original scheme of signals, at 9.55 a.m. three calls (— • — • —) were given, followed by " ordinary time signals," then the signal " wait " (• — • • •).

The " ordinary time signals " commence at 9.56 a.m. and end at 10 a.m. They are transmitted automatically by means of special apparatus situated at the observatory in Paris and managed by the staff of that establishment.

The connection between this apparatus and the radio station at Eiffel Tower is established a few instants before the transmission by means of subterranean lines.

The composition of these signals is given by the illustration on the next page.

The complete minutes 9.58, 9.59, 10.0, are therefore indicated by the end of the 3rd lines of the series of three dashes, all confusion being avoided by the fact that the signals preceding these dashes are different for each minute.

The letters O (— — —) of the first minute and X (— • • —) of the second minute constitute only advice and tuning signals.

* See Diagram.

Diagram illustrating the 10 a.m., Ordinary Time Signal, and the 10.49 and 23.49 Time Signal.

The international service of time signals is shown in the above diagram. The position of the — • — is quite arbitrary. It varies with the different services and is not the same in the two automatic apparatus employed for the transmission of time signals. This is immaterial because it only affects the preliminary signals for the transmitting apparatus and is not utilised for measuring time.

All the dashes, dots, and spaces of dots or dashes of any one letter in the remainder of the signals are of equal duration: dashes = one second, dots = one-quarter of a second, intervals = one second.

The letters N (— •) which characterise the third minute commence at the seconds, 8, 18, 28, 38, 48, and the beginning of the dots of these same letters coincide exactly with the seconds 10, 20, 30, 40, 50.

In the same way the letters G (— — •) characterising the fourth minute commence at the seconds 6, 16, 26, 36, 46, and the beginning of the dots of these same letters coincide exactly with the seconds, 10, 20, 30, 40, 50.

The second set of time signals starts at 10.44 a.m. with a series of "T" (—), followed by one dot at 10.45 a.m. precisely. At 10.46 a.m. the French operator sends a series of "D" (— • •), which is again followed by a dot at 10.47 a.m., whilst at 10.48 a.m. starts a series of "6" (— • • • •), again followed by a dot at 10.49 a.m.

The signals "T," "D," and "6," are sent by hand by an operator at the observatory, only the three dots at 10.45, 10.47, and 10.49, are automatically sent by the special apparatus.

The "ordinary time signals" by night are transmitted in the same way.

The calls are initiated at 11.44 p.m. (or 2344 French time) beginning with a "T" series, followed by a dot at 11.45 p.m., continued by a "D" series at 11.46 p.m., followed by a dot at 11.47 p.m., and completed by a "6" series starting at 11.48 p.m., followed by a dot at 11.49 p.m.

For receiving these hourly signals, termed "ordinary," it is only necessary to have an antenna, of dimensions and height varying according to the distance from Paris, connected with a radiotelegraphic receiver, and to listen to the signals, with the clock or watch to be compared in front of the observer. It is easy for an unskilled person to start by estimating the difference up to half a second between the hours indicated by the clock and those which correspond with the signals that are heard in the telephones of the receiver. After some practice it is quite easy to estimate one-quarter of a second. In order to reach an accuracy of one-tenth of a second it is generally necessary to have recourse to simultaneously recording on the same photographic strip the radiotelegraphic signals and the beats of the clock to be compared. Excellent results have in this way been obtained by various physicists and engineers.

It frequently occurs, especially in winter, that the Paris Observatory is not able to make astronomical observations each night. It is therefore necessary to be satisfied with the times registered by the chronometers of which the rate is known for the setting of the clock which sends the signals. These chronometers being sufficiently numerous and accurate, such a procedure causes no inconvenience so long as the cessation of astronomical observations does not exceed a few days. If, on the other hand, the period of cloudy weather continues too long, it is no longer possible to answer for the accuracy of the chronometers. Wireless telegraphy in such cases furnishes a method which allows of the co-operation of other observatories, better situated as regards climatic conditions, in the determination of the state of the master-clock at Paris, and in consequence in the accurate setting of the clock which sends the signals.

SCIENTIFIC TIME SIGNALS.

Every night at 11.29 p.m. (2329 French time) three calls (— • — • —) are made.

Starting at 11.30 p.m. (2330 French time) a series of 300 dots each formed of a single spark are transmitted, the 60th, 120th, 180th and 240th being suppressed in order to establish the indication for counting purposes.

This series is heard at the observatory in Paris in a wireless receiver and compared with the tickings of a time-keeping clock by the coincidence method.

A simple calculation permits of deducing the times (as marked by the clock) from the coincidences of the 1st and 300th dots of the series, which are exact to 1 or 2 hundredths of a second. These may be transformed into "legal time hours" by adding the corresponding correction of the clock.

These latter hours are transmitted by the Eiffel Tower soon after the end of the "ordinary time signals" at night, in the following manner:—

If the times of the 1st and 300th beats are, for instance, 11 hours 30 minutes 8.15 seconds p.m. and 11 hours 35 minutes 1.17 seconds p.m., the two following groups of figures will be twice repeated:—

— • • • = 300815. 350117 — • • • = 300815. 350117
— • • • = 300815. 350117.

In order to know approximately the correction to be made to a clock (or a chronometer) with reference to the legal international time of the observatory, it is sufficient to listen to the ticking of that instrument by means of a microphone suitably attached to a radiotelegraphic receiver at the same time as the series of 300 points are transmitted by the Eiffel Tower. It is necessary to observe and note the coincidences, and then the hours of the clock (or the chronometer) should be calculated at the moment of the 1st and 300th dots.

By subtracting these times respectively from those sent out by the Eiffel Tower, it is possible to obtain two correcting values for applying to the readings of the clock for measuring time which should be correct to about two hundredths (.02) of a second.

METEOROLOGICAL REPORTS FROM EIFFEL TOWER.

The meteorological messages from the Eiffel Tower contain observations from 22 French stations and from Brussels and Mayence, and are issued at the following hours (Greenwich time):—

2 h. 45 m.	Observations at	1 h.
8 h. 15 m.	"	7 h.
14 h. 15 m.	"	13 h.
19 h. 30 m.	"	18 h.

Wavelength, 2,500 metres.

The information is sent in the following order:—

(1) *Observations at 7 a.m.*

Four groups of five figures for each station.

BBBDD FWTTC βbbRR MMmms

The symbols have their usual significance, but barometric values are expressed in millimetres and tenths and

C = Direction of upper cloud (cirrus and cirrostratus) 0-8 (International Code).

RR = Rain, in millimetres, for previous 24 hours.

MM = Maximum temperature 7 a.m. to 7 a.m.

mm = Minimum Temperature.

S = State of sea, 0-9. (This figure is omitted when the station is inland—only four figures being sent).

Upper Winds.

Two groups of 6 letters for each station:—

D₁ V₁ D₂ V₂ D₃ V₃ D₄ V₄ D₅ V₅ D₆ V₆
D₁ D₂ D₃ D₄ D₅ D₆ Indicates the direction of the wind at the different altitudes.

$V_1 V_2 V_3 V_4 V_5 V_6$ Indicates the force of wind at different altitudes.

D_1 and V_1 at	500 metres.
D_2 and V_2 „	1,000 „
D_3 and V_3 „	1,500 „
D_4 and V_4 „	2,000 „
D_5 and V_5 „	3,000 „
D_6 and V_6 „	4,000 „

The value of the letters employed are shown below.

(2) OBSERVATIONS AT 1, 13 AND 18 HOURS.

One group of five figures, one group of four figures and one group of three figures for each station.

B B B D D F W T T β b b

Upper Winds.

Two groups of six letters for each station.

$D_1 V_1 D_2 D_3 V_4$ $D_4 V_4 D_5 V_5 D_6 V_6$

The telegrams commence by the words :—

Météo France.

The groups of figures and the groups of letters for each station are preceded by a group of two figures indicating the station.

Missing stations are shown by five x's—x x x x x preceded by the number of the station.

Groups of figures are given for the following stations :—

01 Ile d'Aix.	18 Rennes.
02 Biarritz.	19 Strasbourg.
03 Bordeaux	21 Toulouse.
04 Brussels.	22 Tours.
05 Cherbourg.	24 St. Julien.
06 Clermont.	27 Alençon.
07 Dijon.	28 Amiens.
08 St. Inglevert.	29 Cosne.
09 Limoges.	30 Le Havre.
11 St. Mathieu.	31 Istres.
13 Mayence.	32 Metz.
14 Montpellier.	33 Privas.
15 Paris.	34 Sommesous.

Groups of letters are sent for the following stations :—

03 Bordeaux.	15 Paris.
04 Brussels.	17 St. Pierre Quiberon.
14 Montpellier.	19 Strasbourg.

For upper winds the following code is used :—

Direction of Wind.

NNE	a	SSW	i
NE	b	SW	j
ENE	c	WSW	k
E	d	W..	l
ESE	e	WNW	m

EUROPEAN WEATHER REPORT.

This message, issued from the Eiffel Tower (FL) at 11.30 a.m. G.M.T., gives information for 7 a.m. G.M.T. in the code BBDDFW for the following stations :—

S=Stornoway.	V=Valencia.	C=Copenhagen.
HE=Hilder.	PR=Prague.	P=Paris.
O=Ushant.	CF=Clermont-Ferrand.	N=Nice.
PE=Perpignan.	BI=Biarritz.	CR=Corunna.
R=Rome.	A=Algiers.	

The figure groups are followed by a description (in plain language) of the pressure distribution and by a general forecast for the following day.

HOURLY METEOROLOGICAL REPORTS.

Reports are issued daily from le Bourget (ZM) at 30 minutes past each hour in the same code as that used for hourly reports in Great Britain (*q.v.*).

Other meteorological reports are issued from Naval stations on a wavelength of 1,350 metres in the code BBBDD FWTC β bbRR MMmmS for observations at 0700, and BBBDD FWTC β bb for observations at 1300, 1800.

(a) From Mourillon, near Toulon (FUT), at 0915 (observation at 0700), and 1900 (observations at 1800) for : (1) Cap Bearn, (2) Cete, (3) Aubagne, (4) Toulon, (5) St. Raphael, (6) Ajaccio.

Reports begin with the words Meteo-Mourillon. Upper air observations are added in the code DDYY (DD=direction, YY=velocity in m/s) for heights of 200, 500, 1,000 and 2,000 metres.

(b) From Sidi Abdallah reports begin with words Meteo-Sidi-Abdallah, and are issued at 0945 (observations at 0700), 1930 (observations at 1800), for : (1) Djebel Krichtel, (2) Baraki, (3) Cape Garde, (4) Sidi Ahmed, (5) Sfax.

(c) From Dran (FUO) at 0930, 1400, 1945.

(d) From Bizerte (FUA) at 1015, 1415, 2015.

(e) Reports beginning Meteo-Alger are issued at 1345 (observations at 0700) for : (1) Rabat, (2) Nemours, (3) Tenes, (4) Algiers, (5) Cape Garde, (6) Bizerte, (7) Sfax, (8) Marseilles, (9) Colomb Béchar, (10) Laghouat, (11) Tougourt.

FRENCH OCEANIA

The Papeete station (Tahiti Is.) transmits every day, including holidays, on the wavelength of 600 metres, two meteorological reports, one at 11 a.m. and the other at 11 p.m. (G.M.T.), which are made up as follows :—

I.

The reports contain the date of the report of the meteorological station of Point Venus, followed by a group of 8 figures in normal code : BBBDDFWS.

The report is preceded by the following signal : " Tahiti observatoire."

II.

Notice to navigators concerning alterations of lightship or light buoys, the presence of derelicts, and the disappearance of lightbuoys or important buoys, and any other information in regard to navigation, will be added, as occasion arises, in the report. It will be sent out in French and English.

III.

The reports will be transmitted three times in succession ; the first time transmission will be made rapidly, the second and third times slowly.

IV.

A safety signal will be transmitted to ships at any hour of the day or night, repeated at short intervals ten times on full power: Tahiti T.T.T., followed by advice of cyclones, typhoons or derelicts, or any sudden changes in the position or form of fixed obstructions or of land marks. The message will be repeated three times with intervals of ten minutes.

GERMANY

The Nauen high-power station at present broadcasts time signals at noon and midnight (G.M.T.) on a wavelength 3,900 m. in accordance with the Onogo arrangement which was agreed upon at the International Time Conference. This station further transmits at 0900 and 1940 (G.M.T.) "*International Weather Reports*" with the same wavelength.

Following upon the Nauen time Signal, "Weather reports" are transmitted from Norddeich wavelength 600 m., a speed of 60 letters per minute, at noon (G.M.T.). If they do not arrive at Norddeich until after that time, they will be given in the same manner at 1700 (G.M.T.). Further, Norddeich will transmit on the same wavelength and at the same speed "Important News for Seafarers" and "Storm Warnings"; the former are transmitted three times immediately after they are received and are also, as long as may be necessary, repeated three times after the Nauen time signal; the latter are also transmitted three times immediately after receipt, and also are repeated once after the weather reports at noon (G.M.T.), or, if the storm warnings are received later at Norddeich, at 1700 (G.M.T.).

Regarding the furnishing, on payment, of "Weather Information" through the coast stations of Norddeich, Cuxhaven, Bülk, Swinemünde, and Pillau, to passing ships, and regarding which negotiations are still pending, further information will be published in due course in the "Nomenclature Officielle des Stations Radiotélégraphiques" etc.

The observations for 0700 are sent at 0900 in the code

BBBDD FWTTT cbbRR MMmms

and the observation for 1800 are sent at 1940 in the code

BBBDD FWTTW¹ where W¹ refers to past weather.

The stations used are Borkum, Keitum, Hamburg, Swinemünde, Neufahrwasser, Memel, Aachen, Hanover, Berlin, Dresden, Breslau, Karlsruhe, Frankfurt, Munich, Vienna.

GIBRALTAR

A meteorological report is issued twice daily from Gibraltar (BWW) on a wavelength of 2,700 m. at 1400 and 2200 (G.M.T.).

GREECE

Athens transmits a meteorological report at 0700 (GMT) on a wavelength of 1200 metres.

The transmission of meteorological, aviation, and time signals is shortly being placed on a new basis.

HAWAII

Weather bulletins obtained from the United States Weather Bureau at Honolulu are broadcasted daily by the Pearl Harbour Radio Station (NPM) at 8 a.m., noon, 4 p.m., and 8 p.m., and after time signal.

Time Signal.—U.S. Naval Radio Station, Pearl Harbour, T.H., transmits time signals daily on 600-meter damped, and 11,200-meter undamped, waves at noon, 180th meridian time—*i.e.*, at 2355-2400 (G.T.M.), accurate to within 0.2 second with San Francisco Naval Observatory time.

HONG-KONG

A summary of meteorological conditions and weather forecasts will be broadcasted (on a 600-metre wave) by Cape d'Aguilar daily at 1 p.m. Hong-Kong standard time (5 a.m. G.M.T.) and repeated at 5 p.m. Hong-Kong standard time (9 a.m. G.M.T.).

Storm warnings are broadcasted at about noon and repeated every two hours until midnight. If a second warning is issued during the day the later warning will be substituted.

When within range of Cape d'Aguilar, ships send observations made at 6 a.m. and 2 p.m. Hong-Kong time (10 p.m. and 6 a.m. G.M.T.), and a message containing the following information:—

- (a) Ship's name, position and the time of observation (G.M.T.).
- (b) Barometer reading (with no correction whatever).
- (c) Thermometer reading (if the barometer is of the mercurial type).
- (d) Wind direction and force.
- (e) State of weather (in plain language).

The Hong-Kong Observatory also sends wireless Time Signals *via* Cape d'Aguilar at the even seconds between 11.56 a.m. and noon, and between 8.56 p.m. and 9 p.m. Hong-Kong time (3.56 a.m. to 4 a.m. and 12.56 p.m. to 1 p.m. G.M.T.). The 2nd, 28th, 50th, 52nd and 54th second of each of the above minutes are omitted for the purpose of identifying the signals.

The Time Signals are preceded by the following warning signals from Cape d'Aguilar between 11.54 a.m. and 11.55 a.m. and between 8.54 p.m. and 8.55 p.m. Hong-Kong time (3.54 a.m. and 3.55 a.m. and 12.54 p.m. and 12.55 p.m. G.M.T.):—

CQ DE VPS HK TIME WAIT

Both warning and Time Signals are sent out on a wavelength of 1,000 metres from a 5 kw. spark set. The Time Signals are dots of about 0.2 second duration. Radiotelegraphic land and ship stations within range of Cape d'Aguilar are required to keep silent between 11.54 a.m. and noon, and 8.54 p.m. and 9 p.m. Hong-Kong time (3.54 a.m. and 4 a.m. and 12.54 p.m. and 1 p.m. G.M.T.) in accordance with Article 45, paragraph 3 of the Service Regulations appended to the International Radiotelegraph Convention of 1912.

INDIA

Time Signals based on the International system are sent out from Calcutta Radio Station (VWC) twice daily, at 0127-0130 and 1327-1330 (G.M.T.). The wavelength used is 2,000 metres and the power 30 kw. The signals are controlled from the Alipore Observatory at Calcutta.

Should the time signals be inaccurate for any reason, they will be followed by the "erase" signal of nine or more dots and the words "Signal failed."

Arrangements are being made for similar signals to be sent out at 0057-0100 and 1257-1300 (G.M.T.) from Bombay Radio Station (VWB). These signals will be controlled from Colaba Observatory, Bombay.

With regard to weather reports, the following details are published for information.

The Meteorological Department supplies each day to the radio stations concerned messages to be signalled broadcast at the following times and on the specified wavelengths:—

Station.	Call-sign.	Wavelength metres.		Time (G.M.T.)
Bombay	VWB	..	2,000	0100 and 1300
Madras	VWM	..	2,000	
Rangoon	VTR	..	1,200	
Karachi	VWK	..	2,000	
Calcutta	VWC	..	2,000	0130 and 1330
Port Blair	VTP	..	1,200	

These reports do not contain actual observations but only a short description of general conditions prevailing. The report sent out from Bombay and Karachi gives the weather conditions in the East Arabian Sea, while that broadcasted from the other four stations refers to the Bay of Bengal.

ITALY

AEROLOGICAL AND METEOROLOGICAL SERVICE.

I. At present the service is carried out by three groups of stations, the central station of the first group being at Rome, that of the second group at Florence, and that of the third at Naples.

II. Transmissions are made twice a day at the hours given in the table below, in which the length of wave used is also given :—

<i>Groups.</i>	<i>Stations.</i>	<i>Times.</i>	<i>Wave-lengths.</i>
I. Central Station,			
Rome	.. Genoa*	.. 0730 to 0735 1330 to 1335	600 s.
	.. Leghorn	.. 0735 „ 0740 1335 „ 1340	1,200
	.. Ancona	.. 0755 „ 0800 1355 „ 1400	1,200
II. Central Station,			
Florence	.. Padua	.. 0740 „ 0745 1340 „ 1345	900
	.. Turin	.. 0745 „ 0750 1345 „ 1350	900
	.. Milan	.. 0750 „ 0755 1350 „ 1355	900
III. Central Station,			
Naples	.. Vittoria*	.. 0725 „ 0730 1325 „ 1330	600
	.. Maddalena	.. 0730 „ 0735 1330 „ 1335	600
	.. Messina	.. 0735 „ 0740 1335 „ 1340	600
	.. Brindisi	.. 0740 „ 0745 1340 „ 1345	2,500 arc.

III. The Florence and Naples stations transmit a summary of the reports received to Rome (ICD) at the following times, and with the following wave-lengths :—

<i>Stations.</i>	<i>Times.</i>	<i>Wavelength.</i>
Naples	0800 to 0810 1400 to 1410	3,200 arc.
Florence	0810 „ 0820 1410 „ 1420	900 s.

IV. The complete reports are then transmitted from Rome (IDO) at 09.30 and 14.45, with wavelength 11,000c. At 03.45 Rome (IDO) transmits a local weather report to Paris.

V. The aerological stations are identified by the groups of two figures given next to each station :

04 Padua	12 Maddalena
06 Genoa	13 Naples
07 Florence	14 Brindisi
08 Leghorn	16 Messina
09 Ancona	18 Vittoria

* Genoa passes the reports to Leghorn and Vittoria to Messina for transmission to Centocelle.

VI. Other aerological stations will be added to those mentioned above and will commence operations as soon as ready. The complete list with corresponding numbers is as follows:—

01 Turin	11 Rome
02 Milan	12 Maddalena
03 Trent	13 Naples
04 Padua	14 Brindisi
05 Trieste	15 Cagliari
06 Genoa	16 Messina
07 Florence	17 Palermo
08 Leghorn	18 Vittoria
09 Ancona	19 Taranto
10 Chieti	

VII. The reports will be drawn up in the following form:—

BBBcHW/LAdSVD/V₁D₁V₂D₂V₃D₃/V₄D₄V₅D₅V₆D₆

Where BBB and c and S have the usual meaning, but—

H=the relative humidity from 0 to 100 (Table II).

W=the weather at the time of observation (Table III).

L=the amount of cloud (0=nil, 10=overcast).

A=Type of cloud to which the greatest importance is attached (Table V).

d=direction in which clouds are moving according to the eight fundamental directions (Table VI).

V=Velocity of the wind at ground level in m/s (Table VIII).

D=Direction of the wind (Table VI).

V₁D₁V₂D₂, etc., denote the velocity of the wind in m/s and the respective directions at 500 m., 1,000 m., 1,500 m., 2,000 m., 3,000 m., and 4,000 m. above sea-level.

TRANSMISSION OF METEOROLOGICAL REPORTS BY WIRELESS T. JAPAN
(Notification of the Department of Communications No. December 11th, 1914.)

Relating to the transmission of storm warnings at the Wireless Choshi Radio, Fukkikaku, and Dairenwan.

The storm warnings issued by the Central Meteorological at Tokyo are transmitted free of charge to vessels at sea from telegraph stations at Choshi, Fukkikaku and Dairenwan, according to following method (it always being understood that this shall not be case of special transmissions made at the request of vessels):

The storm warnings will be issued in the English language comprise the items referred to in (a) and (b) below:

(a) Text of warning, date, time; position, rate and direction of centre of atmospheric depression or typhoon.

(b) Maritime instructions and notices. When storm warning received at the coastal stations, they will be immediately transmitted will be repeated from the Choshi station at 9.5 p.m., from the station at 8.30 p.m., and from the Dairenwan station at 9 p.m.

Wavelengths of 600 metres are employed, and the storm warning continued three times after the signal "QST" has been thrice received.

NOTIFICATION OF THE DEPARTMENT OF COMMUNICATIONS No. From December 11th, 1916, the following procedure for a central standard time at 1200-1204 (G.M.T.) by wireless telegraph adopted at the Choshi and Funabashi wireless telegraph

NOTES.—Should any data be missing from a group, an equal number of x's are inserted in its place. Should soundings not be taken, the wireless telegraph message concerning one station will consist of only two groups (meteorological); and when the sounding does not reach 2,000 m. the wireless telegraph message will consist of three groups (two meteorological and one aerological).

The "Saseno" IDB wireless telegraph station transmits aerological and meteorological reports at 0700 and 1700 to the ship at Brindisi IDV, with a 600 s. wave.

The wireless telegraph station at Centocelle (Rome) and St. Elmo (Naples) also carry out the following special service for the exchange of reports on local weather conditions, and on the departure and arrival of aircraft for the Rome to Naples and Naples to Rome service.

St. Elmo W/T station, wave 3,200 c.	0700	Exchange of meteorological
	to	information and reports of

JAPAN

TRANSMISSION OF METEOROLOGICAL REPORTS BY WIRELESS TELEGRAPHY.

(Notification of the Department of Communications No. 836,
December 11th, 1914.)

Relating to the transmission of storm warnings at the Wireless Stations at Choshi Radio, Fukkikaku, and Dairenwan.

The storm warnings issued by the Central Meteorological Observatory at Tokyo are transmitted free of charge to vessels at sea from the wireless telegraph stations at Choshi, Fukkikaku and Dairenwan, according to the following method (it always being understood that this shall not apply in the case of special transmissions made at the request of vessels):

The storm warnings will be issued in the English language, and will comprise the items referred to in (a) and (b) below:

(a) Text of warning, date, time; position, rate and direction of movement of centre of atmospheric depression or typhoon.

(b) Maritime instructions and notices. When storm warnings are received at the coastal stations, they will be immediately transmitted, and will be repeated from the Choshi station at 9.5 p.m., from the Fukkikaku station at 8.30 p.m., and from the Dairenwan station at 9 p.m.

Wavelengths of 600 metres are employed, and the storm warnings are continued three times after the signal "QST" has been thrice repeated.

NOTIFICATION OF THE DEPARTMENT OF COMMUNICATIONS NO. 1,105.

From December 11th, 1916, the following procedure for announcing central standard time at 1200-1204 (G.M.T.) by wireless telegraphy was adopted at the Choshi and Funabashi wireless telegraph stations:—

Procedure for Time Signalling by Wireless Telegraphy.

1. Every evening, with the exception of Sundays, Time Signals are automatically made by the transmitting apparatus at the Choshi and Funabashi wireless telegraph stations, as communicated by the Tokyo Observatory through the connected telegraph wires on land. The wavelength of 600 metres is used in the case of the Choshi station and that of 4,000 metres in the case of the Funabashi station.

The time to be signalled in accordance with the above is indicated five times—*viz.*, at 9.0 p.m. (Central Japan Standard Time), 9.01, 9.02, 9.03, and 9.04 (1200-1204 G.M.T.) by means of dashes continuing for one second from the times mentioned, and following the various warning signals distinguished as below :—

(a) The first warning signal, consisting of dashes, will commence at 8.59 p.m., and continue till 8.59.55, after which a suspension of five seconds will be followed by a dash, continuing for one second.

(See table below) :—

	Secs.	0	5	10	15	20	25	30	35	40	45	50	55	0
	h.													h.
a	0859	—	—	—	—	—	—	—	—	—	—	—	—	0900
b	0900													0901
c	0901													0902
d	0902													0903
e	0903													0904

(b) The second warning signal, consisting of a long dash and a dot, will commence at 9.00.30 and continue till 9.00.55, after which a suspension of five seconds will be followed by a dash continuing for one second.

(c) The third warning signal, consisting of a dash and two dots, will commence at 0901.30 and continue till 0901.55, after which a suspension of five seconds will be followed by a dash, continuing for one second.

(d) The fourth warning signal, consisting of a dash and three dots, will commence at 0902.30, and continue till 0902.55, after which a suspension of five seconds will be followed by a dash, continuing for one second.

(e) The fifth warning signal, consisting of a dash and four dots, will commence at 0903.30, and continue till 0903.55, after which a suspension of five seconds will be followed by a dash, continuing for one second.

JUGO-SLAVIA

A meteorological report is issued daily from Belgrade (HFB) at 1345 (G.M.T.).

MALTA

A meteorological message is issued daily at 0900 and 2100 (G.M.T.) by Rinella (BYZ) Wireless Telegraph Station ; wavelength 4,200 C.W.

MAURITIUS

Time Signals are radiated daily by the Mauritius Wireless Station at 9 a.m. and p.m. (G.M.T.) to 9.1 a.m. and p.m. on a wavelength of 2,000 metres Spark, but the times are stated to be not perfectly accurate. The procedure adopted is :—N's made by hand every ten seconds, commencing at 0859 and concluding with a dash at 0900. G's made by hand every ten seconds, commencing at ten seconds past 0900, concluding with a dash operated from Observatory at 0901.

MEXICO

The coast stations of Campeche, Guaymas, Mazatlan de Sinaloa, Payo Obispo and Vera Cruz transmit the time of the meridian of Tacubaya (6 h. 36 m. 46.67 secs. behind Greenwich) daily at noon in the following manner :—

From 11.55 a.m. to noon : repeated transmission of the inquiry signal "CQ" ; then repeated transmissions of the signal "XH" (time of Tacubaya) ;

At noon : transmissions of the word " noon," always followed by a free announcement of the state of the weather.

NETHERLANDS

Since July 1st, 1915, the station of Scheveningen Harbour has been sending at 11.15 and 23.15 (Greenwich time) on a wavelength of 1,800 metres a meteorological radiotelegram in Dutch and English, followed by a storm signal whenever necessary and also a notice to mariners in Dutch and English.

The meteorological radiotelegram is preceded by the letters KNMI, and consists of four sets of two groups of five figures each for the stations Helder, Flushing, Gris Nez, and The Hague, and, further, of four sets of two groups wherein one group has five and the other group four figures each for the stations Yarmouth, Shields, Skudnaes and Sylt, according to the scheme.

BBBDD FWTT(S).

The letter x is used to denote missing figures.

Following the above comes, if deemed important, first, the storm signal—*e.g.*, warning signal, signal of shifting south-east storm ; second, the notice to mariners, preceded by the letters NBAZ—*e.g.*, wreck, mouth Hook of Holland.

Examples of meteorological radiotelegrams from the first and the fifth of the eight sets of two groups KMNI are 69010-21541 and 57316-4405 ; their translations follow :—

HELDER.	YARMOUTH.
Barometer, 769.0 mm.	Barometer, 757.3 mm.
Wind direction, E.S.E.	Wind direction, south.
Wind force, very light.	Wind force, moderate.
Sky, slightly cloudy.	Sky, overcast.
Temperature, 4° C.	Temperature, 5° C.
Sea, very smooth.	

Meteorological reports are also issued from Soesterberg at 0820, 1020 and 1420 (G.M.T.) since May, 1920, giving information for Helder (01), Flushing (02) and de Bilt (03) in the code BBBDD FWTTV.

NEW ZEALAND

(See Australasia.)

NORWAY

Meteorological Reports are issued according to the following scheme from Christiania :—

Length of wave	8,000 metres (C.W.)
Call signal	LCH
Normal range	1,100 km.
Hour of sending	0845 (G.M.T.)
" "	1550 "
" "	2010 "
Hour of observation	0700 "
" "	1300 "
" "	1800 "

List of observation stations and their identification numbers and positions :—

Identification Number.	Place.	Latitude.	Longitude.
01	Vardö	70° 22'	31° 08'
02	Spitzbergen	78° 02'	14° 14'
03	Tromsø	69° 39'	18° 58'
04	Bodo	67° 17'	14° 24'
05	Bronno (Bron Is)	65° 28'	12° 13'
06	Christiansund	63° 07'	07° 45'
07	Floro	61° 36'	05° 02'
08	Skudenes	59° 09'	05° 16'
09	Okso	58° 04'	08° 04'
10	Faerder	59° 02'	10° 32'

Each radiogram begins with the words: Met. Norwegian. The code for the 0700 observations is :—

BBBDD FWTC cbbRR

The code for the 1300 and 1800 observations is :—

BBBDD FWTTk cbbrr

in which *k* gives the weather since the last observation according to the code.

0—Clear without precipitation.

1—Half-covered without precipitation.

2—Overcast

3—Fog

4—Storm

5—Rain (snow) showers, sky partly covered (days on which there are gleams of sunshine).

6—Sky overcast with rain (snow), occasional showers.

7—Incessant fog, mist, fine rain (slight snowfall).

8—Rain (snow) continuous with a few breaks, no gleams of sunshine.

9—Incessant rain (snow).

r—Indicates the time of commencement of the precipitation according to the code.

O—No precipitation since 7 (13) o'clock.

1—Precipitation began between 7 and 8 (13 and 14) o'clock.

2 " " 8 9 (14 15) "

3 " " 9 10 (15 16) "

4 " " 10 11 (16 17) "

5 " " 11 12 (17 18) "

6 " " 12 13 o'clock (does not apply in the evening reports).

7 " " before 8 a.m. (13 p.m.).

8 " " hour unknown.

9—Not known whether there was precipitation or not. In cases where the precipitation was in the form of showers the time when the first shower started should be given, and

s—Indicates the time the precipitation ceased according to the code.

o—No precipitation since 7 (13) o'clock.

International Time and Weather Signals

1—Precipitation ceased between 7 and 8 (13 and 14) o'clock
2 " " 8 9 (14 15) "
3 " " 9 10 (15 16) "
4 " " 10 11 (16 17) "
5 " " 11 12 (17 18) "
6 " " 12 13 o'clock (does not evening report).

7 " " still continuing at 13 (18) o'clock a.m. (p.m.)
8—Hour of ceasing unknown.

9—Not known whether there was precipitation or not. In cases where precipitation was in the form of showers the time when the last shower should be given.

N.B.—The figures 8 and 9 for r and s are to be used in cases only.

In the above telegram the morning observations from Vardö (02) and Bodö (04) are missing. These morning observations will be found in the 1300 telegram after the groups 0107, 0207 (which indicate Vardö, Spitzbergen and Bodö at 0700).

PANAMA

(See United States.)

PHILIPPINE ISLANDS

Time Signals are transmitted from Manila to every Telegraph station over the country by land lines every day at 1100 a.m. (0300 G.M.T.) clock of the Central Observatory, which is connected with the Posts telegraph office at Manila by a land line, is connected with the circuit at 10.55 a.m. Time signals are then sounded. In the minute before 11.00 a.m. the operator at the central office dots with during 20 seconds to indicate that it is the half half minute. They are omitted in order to give a chance to adjust instruments to the final corrected time. Then, at the expiration of the 10 seconds, a dash is given, thus completing the time and correcting the clocks in the country.

The wireless stations at Malabang and Cuyo broadcast Manila transmitted to them from Manila by land lines, every day at 11 a.m. (0300 G.M.T.). The radio station of the Navy Department at Cavite broadcasts time signals at 11.00 a.m. and 10.00 p.m. daily (0255-1355-1400 G.M.T.) on wavelengths of 952 m. (Spark) and 5,000 m. Weather warnings are sent immediately after the time signals.

Weather reports are exchanged regularly between the observatory at Manila and that of Guam, via the Naval radio station at Cavite. Warnings are also sent to Hanoi, French Indo-China, via Cavite. In the near future weather warnings will also be broadcasted station at Batangas.

- 1—Precipitation ceased between 7 and 8 (13 and 14) o'clock.
 2 " " " 8 9 (14 15) "
 3 " " " 9 10 (15 16) "
 4 " " " 10 11 (16 17) "
 5 " " " 11 12 (17 18) "
 6 " " " 12 13 o'clock (does not apply to evening report).
 7 " still continuing at 13 (18) o'clock a.m. (p.m.).
 8—Hour of ceasing unknown.
 9—Not known whether there was precipitation or not. In cases where precipitation was in the form of showers the time of ceasing of the last shower should be given.

N.B.—The figures 8 and 9 for r and s are to be used in exceptional cases only.

PANAMA

(See United States.)

PHILIPPINE ISLANDS

Time Signals are transmitted from Manila to every Telegraph Station all over the country by land lines every day at 1100 a.m. (0300 G.M.T.). The clock of the Central Observatory, which is connected with the Bureau of Posts telegraph office at Manila by a land line, is connected to the telegraph circuit at 10.55 a.m. Time signals are then sounded. In the last half minute before 11.00 a.m. the operator at the central office dots with the key during 20 seconds to indicate that it is the half half minute. Ten seconds are omitted in order to give a chance to adjust instruments to receive the final corrected time. Then, at the expiration of the 10 seconds, a long heavy dash is given, thus completing the time and correcting the clocks in all offices.

The wireless stations at Malabang and Cuyo broadcast Manila time, transmitted to them from Manila by land lines, every day at 11 a.m. (0255-0300 G.M.T.). The radio station of the Navy Department at Cavite also broadcasts time signals at 11.00 a.m. and 10.00 p.m. daily (0255-0300 and 1355-1400 G.M.T.) on wavelengths of 952 m. (Spark) and 5,000 m. (arc.). Weather warnings are sent immediately after the time signals.

Weather reports are exchanged regularly between the observatory at Manila and that of Guam, *via* the Naval radio station at Cavite. Weather warnings are also sent to Hanoi, French Indo-China, *via* Cavite.

In the near future weather warnings will also be broadcasted from the station at Batangas.

POLAND

The Warsaw Central Station transmits press and meteorological reports at 10 a.m., 5.30 p.m., and at midnight (0840, 1530, 2200 G.M.T.). (Call signal WAR, Wavelength 2,000 m.). The code used for the meteorological report is as follows:—

For 0700 reports NN BBBDD FWTTTC cbb RR MMmm where NN stands for the station number

and the observations are sent for 01 Posen, 02 Warsaw, 03 Vilna, 04 Lodz, 05 Lublin, 06 Cracow, 07 Tarnow, 08 Lemberg, 09 Ronne, 10 Pinsk, 11 Zakopane, 12 Konitz, 15 Hela, 17 Rixhofs, 18 Puck, 19 Dantzig.

Upper wind reports are added in a letter code identical with that used for reports from the Eiffel Tower (France), *q.v.*

PORTUGUESE EAST AFRICA

Time signals are sent out twice daily from Lourenço Marques at 7.57 to 8 a.m., and 6.57 to 7 p.m. (G.M.T.), on a wavelength of 600 metres following the system of the Eiffel Tower Ordinary 10 a.m. Time Signal, *q.v.*

Following every time signal, a local weather report is transmitted in English as follows:—

CRZ Weather Report—at 8 a.m. G.M.T. (or 7 p.m. G.M.T.).
Pressure at sea level 760.5 millimetres, wind E.N.E. strong, sea rough.
Campos Rodrigues Observatory, Lourenço Marques.

PUERTO RICO

The San Juan Station is used for collecting meteorological data from the adjacent American Islands of the West Indies and from Cuba, and this information is, in turn, transmitted to the United States *via* the high power station at El Cayey, Puerto Rico.

ROUMANIA

A meteorological report is issued once daily from Bucharest (BNS) at 1400 (G.M.T.?) on a wavelength of 4,000 or 7,000 m.

SAMOA

Local weather bulletins, preceded by the letter T are broadcasted by the Tutuila Naval Radio Station (NPU) at 8 a.m., noon, 4 p.m., and 8 p.m.

SOUTH AFRICA

The radiotelegraphic stations at Capetown (Slangkop) and Durban signal at 1.15 o'clock in the afternoon of each day (1115 G.M.T.) weather reports containing information relative to the meteorological conditions affecting the coastal belt of the South African Union.

The arrangements made in the Union of South Africa for the transmission of radio time signals for the use of shipping in South African waters is as follows:—

A special clock at the Royal Observatory, Capetown, is adapted to give automatically a series of signals of a distinctive character extending over an interval of half a minute. The clock is brought into conformity daily with the observatory standards shortly before the hour selected for transmitting the signals. The hour chosen is 11 p.m., Union standard time (9 p.m. G.M.T.).

The time signal is preceded by the usual warning signal from the radio coast station. The time signal proper consists of twelve dashes, each of about $\frac{1}{4}$ of a second in duration, in five groups, commencing at the following Greenwich mean times:—

RADIOTELEGRAM AT 1530 H.

This will contain the observations made at 13 h. (G.M.T.) at the same stations mentioned for the previous radiotelegram, and drawn up in the same manner.

Next appears a group of nine signs which express the state of the sea on our coasts, in conformity with the following rule: the first sign from the left indicates the state of the sea on that part of the coast comprised between San Sebastián and Santander; the second between Santander and Cape Estaca de Vares; the third between Cape Estaca de Vares and the Portuguese frontier; the fourth between Huelva and Gibraltar; the fifth between Gibraltar and Almería; the sixth between Almería and Valencia; the seventh between Valencia and the French frontier; the eight in the Balearic Isles; and the ninth in Argelia.

This is followed by a group of eleven signs, indicating the probable weather for the following twenty-four hours: the first sign from the left indicates the probable weather in the regions of Galicia, Asturias and León, giving preference to that concerning the coast; the second corresponds to the provinces of Santander, Vizcaya and Guipúzcoa, likewise giving preference to the phenomena most interesting to navigators; the third, the weather which will be experienced in the central part of Spain, the provinces of Burgos, Palencia, Navarra, Logroño, Valladolid, Soria, Zaragoza, Zamora, Segovia, Guadalajara, Salamanca, Avila, Madrid, Teruel, Cáceres, Toledo, Cuenca, Badajoz, Ciudad Real, and Albacete, giving preference to the kinds of weather interesting to agriculturists; the fourth, the probable weather in the north-eastern part of Spain, provinces of Huesca, Lérida, Gerona, Barcelona and Tarragona, in its part which most interests farmers and navigators; the fifth, the weather in Levante: provinces of Castellón, Valencia, Alicante, and Murcia, in the part which interests farmers and navigators; the sixth, the weather in Andalusia: provinces of Córdoba, Sevilla, Huelva, Cádiz, Málaga, Jaén, Granada and Almería, giving preference to the weather interesting agriculturists; the seventh, the weather in the Straits of Gibraltar and north part of Morocco, giving preference to weather interesting navigation; the eighth, the weather in the Balearic Isles and in the adjacent zone in the Mediterranean, giving preference to weather interesting navigation; the ninth, in the English Channel and Northern Cantábrico; the tenth corresponds to the part of the Atlantic near to Portugal; and the eleventh to the Canaries. Naturally, the limits of these zones cannot be perfectly defined, and it therefore remains for those who may make use of these services to discriminate, according to circumstances, whether the prognostication of one or other of the immediate regions is to be taken into account.

When, owing to lack of telegrams or other circumstances, the weather cannot be predicted as regards a specific district, the letter X will be substituted for the corresponding sign.

When it is required to signal the position of a cyclonic centre or line of squall (Grain) dangerous to navigation or aviation, the word "precaución" will be transmitted, and afterwards groups of six signs, which, if they refer to cyclonic centres, will commence with CI, and be followed by the group nnLLBB, in which the first two, nn, will indicate the latitude of the centre expressed in complete degrees; the third and fourth, LL, the geographical longitude also of the said centre to the east or to the west of the Meridian of Greenwich, expressed in complete degrees, those of the west, 01, 02, 03, etc., and those of the east by 51, 52, 53, etc.; the fifth and sixth signs, BB, will give the number representing the atmospheric pressure in millibars, omitting the hundreds. If it is a line of squall, it will be given in groups of eight signs, preceded by Gr, and followed by IILLBBDD, the first four, IILL, indicating the position of the point of the line at which the barometer is the lowest; the fifth and sixth, the atmospheric pressure at this point in millibars, and without hundreds; and the last two, DD, the direction of the line of squall at 13 h.

When a regular service of storm signals is established at ports, there will be indicated by a group of ten figures those signals which it is necessary to establish at different parts of our coasts. The successive signs will correspond to the parts of the coast as indicated below : 1, Cantabrian Coasts from Cape Higuer to Cape Mayor ; 2, from Cape Mayor to Cape Estaca de Vares ; 3, Galician Coast from Cape Estaca de Vares to the Portuguese frontier ; 4, from Cape Creus to Cape San Antonio ; 5, Balearic Islands ; 6, from Cape San Antonio to Cape Gata ; 7, Cape Gata to the Straits of Gibraltar ; 8, Straits of Gibraltar to the Portuguese frontier ; 9, East Coast of Africa (Tánger-Arcila) ; 10, Canaries.

RADIOTELEGRAM OF 2030 H.

This will contain observations made at 18 h. at the stations 1, 2, 3 and 4 of the previous radiotelegrams expressed in the form indicated above.

GENERAL REMARKS APPERTAINING TO RADIOTELEGRAMS.

When the results of a meteorological station do not arrive at Carabanchel in time for transmission, the initial of the name of such station will be placed at the corresponding place in the radiotelegram with the words " no llegó " (not arrived).

If one or more of the groups of the station should be lacking, XXXXX will be substituted for each one of them.

If the soundings have not been made by the station, it will be sufficient to suppress the corresponding groups.

If the soundings have been made but are incomplete, XXXX will be substituted for the group or groups which are missing.

Regarding stations shown in the radiotelegrams which are situated on the coast, only particulars of the state of the sea can be given with precision for San Fernando, La Coruna and Mahón ; therefore for the others the fifth figure of its fourth group will express the state of visibility of the horizon. (See instructions.)

The particulars regarding the state of the sea which are shown in a special group in the radiotelegram of 15.30 h., are those received from semaphores and certain vessels.

SWEDEN

Meteorological reports are issued twice daily from the radio station at Karlsborg on a wavelength of 2,500 m. (C.W.) at 0850 and 1930 (G.M.T.), giving observations made at 0700 and 1800 (G.M.T.).

Messages begin with the words *Meteo Suede* and the following index numbers are used.

01 Stockholm	05 Karlstad
02 Hernosand	06 Saerna
03 Haparanda	07 Storlieu
04 Wisby	08 Jonkoping

The observations at 0700 are issued in the code

BBBDD FWTTT cbbRR MMmmS

except for Saerna and Jonkoping, which use the code

BBBDD FWTTT T¹T¹T¹RR MMmmS
(T¹T¹T¹=wet bulb).

The observations at 1800 are issued in the code

BBBDD FWTTW¹ cbb99

At the end of the 0700 reports upper winds at Stockholm will be given in the code

D₁D₁V₁V₁D₂ D₂V₂V₂D₃D₃ V₃V₃D₄, etc.

for heights of 500, 1,000, 1,500, 2,000, 3,000, 4,000 m., direction being given in points (1-32) and speed in metres per second.

TURKEY

Weather reports are issued three times daily from Constantinople (OSM) at 0515, 0845, 1545 (G.M.T.?).

UNITED KINGDOM

Collective data messages are issued four times daily, according to the following scheme. These messages are intended to give information necessary for the preparation of weather maps.

AIR MINISTRY.

Wavelength	3,300 m.
Times of issue (G.M.T.)	0230
"	"	"	"	"	0830
"	"	"	"	"	1430
"	"	"	"	"	1930

Reports will be sent for the following stations:—

Place.	Identification Number.	Place.	Identification Number.
Lerwick	101	Scilly	166
*Aberdeen	110	Pembroke	169
Tynemouth	118	Holyhead	174
*Manchester (Didsbury)	128	*Glasgow	178
*Cranwell	131	Malin Head	182
Yarmouth	136	*Baldonnel	184
*Felixstowe	143	*Valencia	192
*Calshot	153	Stornoway	195
*Lympe	154	Ross-on-Wye	198
Croydon	159	Blacksod Point	199
Jersey	160		

The identification number of each station will be followed by three groups of five figures, represented symbolically by:—

BBBDD FwwTT cbbHV

where BBB = Barometer in millibars and tenths (initial 9 or 10 omitted).

DD = Wind direction at surface on the scale 0-32 (08 = E., 16 = S., 20 = S.W., etc.).

F = Wind force on Beaufort Scale.

w = Present weather.

TT = Temperature in degrees Fahrenheit.

c = Characteristic of barometric tendency.

bb = Amount of barometric tendency in half millibars (50 added for negative tendency).

H = Humidity.

V = Surface visibility.

International Time and Weather Signals

A hyphen - (Morse signal — • • • —) will be used in the any missing figure.

In the case of stations marked * a fourth group will be added, as follows:—

2 DDVV

where DD = Direction of wind at 2,000 feet on the scale. Actual direction in degrees from North is by multiplying code figures by 5.

VV = Speed of wind at 2,000 feet in miles per hour.

The necessary codes are given on pp. 1045-1047.

In addition to these data messages an inference stating in plain what the general trend of wind and weather is likely to be, is issued from G.F.A. at 0915 and 2015 (G.M.T.) daily.

HOURLY REPORTS.

Hourly reports are issued at 35 minutes past each hour from 07 (G.M.T.) by W/T as follows:—

Call sign	GFA.
Wavelength	1680 m. (c.w.)

After the call sign GFA comes the word "METEOR," in which a meteorological message is being transmitted. This is followed by a four-figure group, giving the hour (G.M.T.) at which the observation was made: this time group is in turn followed by station index letters, groups giving the conditions at the following stations:—

Index Letters.	Station.
FXT	
CDN	Felixstowe.
BGL	Croydon.
LMP	Biggin Hill.
BCD	Lympe.
DNS	Beachy Head.
BOTLEY	Dungeness.
	Botley Hill (North Downs).

The letters DNS, when included, will be followed by a figure as the last figure of the fourth group of the report for LMP (Lympe) as the last figure of the fourth group of the report for BCD (Beachy Head).

The word "BOTLEY" is followed by a statement in plain language of the conditions on the North Downs as viewed from Biggin Hill, with a statement adds material information to that contained in the report message.

At the end of the message a short forecast is given in plain language of the changes in the weather conditions anticipated in the period of following the time of issue.

This begins with the word "FORECAST."

If there is no reason to modify the forecast sent in the preceding words "Forecast unaltered" are sent.

The complete results of a pilot balloon ascent at Croydon or when available, are inserted immediately before the forecast.

This part of the message is preceded by the index letters of the and by the five-figure index group 49860.

A hyphen - (Morse signal — • • • —) will be used in the place of any missing figure.

In the case of stations marked * a fourth group will be added when possible, as follows —

2 DDVV

where DD = Direction of wind at 2,000 feet on the scale 0-72.
Actual direction in degrees from North is obtained by multiplying code figures by 5.

VV = Speed of wind at 2,000 feet in miles per hour.

The necessary codes are given on pp. 1045-1047.

In addition to these data messages an inference stating in plain language what the general trend of wind and weather is likely to be, is issued by W/T from G.F.A. at 0915 and 2015 (G.M.T.) daily.

HOURLY REPORTS.

Hourly reports are issued at 35 minutes past each hour from 0735 to 1635 (G.M.T.) by W/T as follows:—

Call sign	GFA.
Wavelength	1680 m. (c.w.)

After the call sign GFA comes the word "METEOR," indicating that a meteorological message is being transmitted. This is followed by one four-figure group, giving the hour (G.M.T.) at which the observations were made: this time group is in turn followed by station index letters and figure groups giving the conditions at the following stations:—

Index Letters.	Station.
FXT	Felixstowe.
CDN	Croydon.
BGL	Biggin Hill.
LMP	Lympne.
BCD	Beachy Head.
DNS	Dungeness.
BOTLEY	Botley Hill (North Downs).

The letters DNS, when included, will be followed by a figure giving the Channel visibility at Dungeness. The channel visibility at *Hythe* is given as the last figure of the fourth group of the report for LMP (Lympne), and the channel visibility at Beachy Head is given as the last figure of the fourth group of the report for BCD (Beachy Head).

The word "BOTLEY" is followed by a statement in plain language of the conditions on the North Downs as viewed from Biggin Hill, when such a statement adds material information to that contained in the rest of the message.

At the end of the message a short forecast is given in plain language of the changes in the weather conditions anticipated in the period of daylight following the time of issue.

This begins with the word "FORECAST."

If there is no reason to modify the forecast sent in the preceding message the words "Forecast unaltered" are sent.

The complete results of a pilot balloon ascent at Croydon or Lympne, when available, are inserted immediately before the forecast.

This part of the message is preceded by the index letters of the station and by the five-figure index group 49860.

The groups following the index group are in the form HDDVV, where H is the height according to the scale of the International Convention for Aerial Navigation, viz. :—

1	refers to a height of	200 metres or	500 feet
2	"	"	500 "
3	"	"	1,000 "
4	"	"	1,500 "
5	"	"	2,000 "
6	"	"	3,000 "
7	"	"	4,000 "
8	"	"	5,000 "

DD is the direction of the wind on the scale 0-72 at the height H.
VV is the speed of the wind in miles per hour.

The following is a specimen message :—

GED	Meteor	0900 G.M.T.	
CDN	20354	60003	05656 24728
BGL	21454	00001	77624 6---
LMP	21555	79512	05655 24940
BCD	22665	70001	43815 5754

BOTLEY in clouds.

FORECAST. Wind changing to west after noon, cloud lifting and visibility improving afterwards.

The information contained in the messages should be entered after decoding in a suitable form.

- I. If any figures are missing, a hyphen or dash is transmitted in place of each missing figure.
- II. When the upper wind at 2,000 feet is not available at any station, the group for upper wind at that station is omitted from the message. Similarly for inland stations the group $h_1S_1SV_1$ is omitted altogether when there is no cloud below 1,000 feet.

CODES.

Symbolically the code for the individual stations is as follows :—

DDFD₁F₁ ALEMH wwWWV $h_1S_1SV_1$ $2D_2D_2VV$

Where the letters have their usual significance (see pp. 1045-1047), but height of base of low cloud below 1,000 feet is as follows :—

1—Cloud below	50 metres	or 150 feet (nearly)
2—Cloud between	50 metres and 100 metres	or 150 and 350 feet
3—	100 " "	150 " " 350 " 500 "
4—	150 " "	200 " " 500 " 650 "
5—	200 " "	250 " " 650 " 800 "
6—	250 " "	300 " " 800 " 1,000 "

FORECASTS.

Forecasts are issued daily by wireless as follows :—

Time of Issue.	Period of Forecasts.	Area.	Station and Wavelength.
0100	Following 24 hours.	North Sea	Cleethorpes.
		56° N. to 60° N.	3,000 m.
0500	Following 12 hours.	North Sea.	Cleethorpes.
			3,000 m.
0700	Following 24 hours.	West and South-West Coasts.	Poldhu.
			2,700 m.
1030	Following 24 hours.	Sea.	Cleethorpes.
		60° N. to 64° N.	3,000 m.
1700	Following 12 hours.	North Sea.	Cleethorpes.
			3,000 m.

GALE WARNINGS.

Gale warnings are issued by W/T from the following stations, length of 600 m. whenever an atmospheric disturbance is developing which is likely to cause a gale (Beaufort force 8) at sea within 150 miles of the issuing station :—

Malin Head	GMH	Seaforth
Valentia	GCK	Niton
Land's End	GLD	Wick
Fishguard	GRL	Cullercoats

UNITED STATES OF AMERICA

TRANSMISSION OF TIME SIGNALS AND HYDROGRAPHIC

NAVAL RADIO STATIONS.

The transmission of time signals to vessels at sea by radio telegraphy was first accomplished in the United States in 1896. The service, enlarged and extended, has continued to the present time, as given by the transmitted signals, may be compared with a chronometer and the error of the chronometer found. Similar over a number of days enable data to be obtained by which not only may be found but also the chronometer rate; that is, the rate of gaining or losing.

The noontime signals on the Atlantic coast are sent out through coast radio stations by connection with Western Union Telegraph Company. The United States Naval Observatory at Washington, D.C. By the proper relays in electrical circuits, the beats of the seconds of a standard time, as given by the transmitted signals, may be compared with a chronometer and the error of the chronometer found. Similar over a number of days enable data to be obtained by which not only may be found but also the chronometer rate; that is, the rate of gaining or losing.

Time signals are now sent out on the Atlantic coast only through radio stations at Washington (NAA), Annapolis (NSS), Key West and New Orleans (NAT). Signals from Washington, Annapolis and West are sent out every day in the year twice a day, viz., from 11.55 noon, and from 9.55 to 10 p.m., seventy-fifth meridian time. Time from New Orleans are sent out daily, including Sundays and holidays, commencing at 11.55 a.m., seventy-fifth meridian standard time, and ending at 11.55 p.m., seventy-fifth meridian standard time.

On the Pacific coast the time signals are sent broadcast to sea through the naval radio stations at San Francisco (NPH), Eureka (NPW), Arguello (NPK), and San Diego, Calif. (NPL), and at North Head (NPE). The controlling clock for each station is in the naval observatory at the Mare Island Navy Yard. Signals from all these stations are sent every day from 11.55 to noon, one hundred and twentieth meridian time, but point Arguello, and San Diego do not send on Sundays and holidays.

On the Great Lakes the time signals are sent broadcast through radio station at Great Lakes, Ill. (NAJ), daily, except on Sundays and days, from 10.55 a.m. to 11 a.m., ninety-fifth meridian standard time. To get the maximum clearness of signals, the receiving circuit is tuned to that of the sending station. The wavelengths used are :—

Annapolis	17,000 metres.
Washington	2,500 metres.
San Francisco	2,400 and ..

GALE WARNINGS.

Gale warnings are issued by W/T from the following stations on a wavelength of 600 m. whenever an atmospheric disturbance is approaching or developing which is likely to cause a gale (Beaufort Force 8) in the open sea within 150 miles of the issuing station :—

Malin Head	GMH	Seaforth	GLV
Valentia	GCK	Niton	GMI
Land's End	GLD	Wick	BYG
Fishguard	GRL	Cullercoats	GCC

UNITED STATES OF AMERICA

TRANSMISSION OF TIME SIGNALS AND HYDROGRAPHIC INFORMATION BY NAVAL RADIO STATIONS.

The transmission of time signals to vessels at sea by means of radiotelegraphy was first accomplished in the United States in 1905, and this service, enlarged and extended, has continued to the present time. This service is of the greatest value to mariners, as it furnishes a means by which the time, as given by the transmitted signals, may be compared with a ship's chronometer and the error of the chronometer found. Similar comparisons over a number of days enable data to be obtained by which not only the error may be found but also the chronometer rate; that is, the rate at which it is gaining or losing.

The noontime signals on the Atlantic coast are sent out through the coast radio stations by connection with Western Union Telegraph lines from the United States Naval Observatory at Washington, D.C. By the operation of proper relays in electrical circuits, the beats of the seconds of a standard clock in the observatory are sent out broadcast as a series of radio dots, commencing five minutes before the time of the final signal. By omitting certain dots in a series, the comparison between the dots and the beats of the chronometer seconds can be checked until the instant of local noon (seventy-fifth meridian time) is reached. This is marked by a longer dot, which gives the time of exact noon. A comparison with the chronometer time at that instant gives its error referred to the seventy-fifth meridian time. Applying the difference in longitude, namely five hours, between the seventy-fifth meridian and Greenwich, which is the standard meridian (or 0° longitude), the error of the chronometer referred to Greenwich time is determined.

Time signals are now sent out on the Atlantic coast only through the radio stations at Washington (NAA), Annapolis (NSS), Key West (NAR), and New Orleans (NAT). Signals from Washington, Annapolis and Key West are sent out every day in the year twice a day, *viz.*, from 11.55 a.m. to noon, and from 9.55 to 10 p.m., seventy-fifth meridian time. Time signals from New Orleans are sent out daily, including Sundays and holidays, commencing at 11.55 a.m., seventy-fifth meridian standard time, and ending at noon.

On the Pacific coast the time signals are sent broadcast to sea through the naval radio stations at San Francisco (NPH), Eureka (NPW), Point Arguello (NPK), and San Diego, Calif. (NPL), and at North Head, Wash. (NPE). The controlling clock for each station is in the naval observatory at the Mare Island Navy Yard. Signals from all these stations are sent out every day from 11.55 to noon, one hundred and twentieth meridian standard time, but point Arguello, and San Diego do not send on Sundays and holidays.

On the Great Lakes the time signals are sent broadcast through the naval radio station at Great Lakes, Ill. (NAJ), daily, except on Sundays and holidays, from 10.55 a.m. to 11 a.m., ninetyeth meridian standard time.

To get the maximum clearness of signals, the receiving circuit should be tuned to that of the sending station. The wavelengths used are as follows :—

Annapolis	17,000 metres.
Washington	2,500 metres.
San Francisco	2,400 and 4,800 metres.

North Head	2,800 metres.
San Diego	2,400 and 9,800 metres.
Eureka	2,000 metres.
Great Lakes	1,512 metres.
Key West	1,500 metres.
Point Arguello	1,512 metres.
New Orleans	1,000 metres.

Both San Francisco and San Diego transmit time signals on undamped waves simultaneously with the transmission on damped waves, using an arc transmitter in each case. The arc transmitter is far more powerful than the spark transmitter, and the signals should be audible over a much greater range. They can, of course, only be received on apparatus specially equipped to receive undamped signals.

PANAMA.

Time is transmitted by Balboa (Canal Zone), call letters NBA, at 12.55 to 1 p.m. and at 4.55 to 5 a.m., seventy-fifth meridian time, on 7,000 metres. Undamped waves are used, but so interrupted by a chopper as to be audible on a crystal detector.

Also time is transmitted by Colon (Canal Zone), call letters NAX, at the same times, on 1,500-metre spark.

In this connection it will be noted that Darien has been operated by distant control from Balboa. The station is called Balboa, and the call NBA is used for both.

At 1 p.m. daily, seventy-fifth meridian time, a time-ball is dropped from the top of the mast on the Signal Station on Sosa Hill, Balboa.

The following table summarises the issues in a convenient form :—

Station.	Call Letters.	Wave-Lengths.	When sent.
		Metres.	
Washington	NAA	2,500	Daily at 11.55 a.m. to noon and 9.55 p.m. to 10.00 p.m., standard time, 75th meridian. 0255-0300, 1655-1700 G.M.T.
Annapolis	NSS	17,000 (arc)	Daily at 11.55 a.m. to noon and 9.55 p.m. to 10.00 p.m. standard time, 75th meridian. 0255-0300, 1655-1700 G.M.T.
Key West	NAR	1,500	Daily at 11.55 a.m. to noon, standard time, 75th meridian. 1655-1700 G.M.T.
New Orleans	NAT	1,000	Daily at 11.55 a.m. to noon, standard time, 75th meridian. 1655-1700 G.M.T.
Balboa, Panama ..	NBA	7,000 (arc)	Daily at 4.55 to 5.00 a.m. and 12.55 to 1.00 p.m., standard time, 75th meridian. 0955-1000, 1755-1800 G.M.T.
Colon, Panama ..	NAX	1,500 (spark)	Daily at 4.55 to 5.00 a.m. and 12.55 to 1.00 p.m., standard time, 75th meridian, 0955-1000, 1755-1800 G.M.T.
Cavite, Philippines ..	NPO	952 (spark) 5,000 (arc)	Daily at 10.55 to 11.00 a.m. and 9.55 to 10.00 p.m., standard time, 120th meridian, East. 0255-0300, 1355-1400 G.M.T.
North Head, Wash. ..	NPE	2,800	Daily at 11.55 a.m. to noon, standard time 120th meridian, West. 1855-1900 G.M.T.
Eureka, Calif. ..	NPW	2,000	Daily at 11.55 a.m. to noon, standard time, 120th meridian, West. 1855-1900 G.M.T.
Point Arguello, Calif.	NPK	1,512	Daily, except Sundays and holidays, at 11.55 a.m. to noon, standard time, 120th meridian, West. 1855-1900 G.M.T.
San Diego, Calif. ..	NPL	9,800 (arc) 2,400 (spark)	Daily, except Sundays and holidays, at 11.55 a.m. to noon, standard time, 120th meridian, West. 1855-1900 G.M.T.
San Francisco, Calif. ..	NPH	4,800 (arc) 2,400 (spark)	Daily at 11.55 a.m. to noon, standard time, 120th meridian, West. 0555-0600, 1955-2000 G.M.T.
Great Lakes, Ill. ..	NAJ	1,512	Daily, except Sundays and holidays, at 10.55 a.m. to 11.00 a.m., standard time, 90th meridian. 1555-1600 G.M.T.
Pearl Harbour, Hawaii	NPM	11,200 (arc) 600 (spark)	Daily at 180th meridian mean noon. 2355-2400 G.M.T.

HYDROGRAPHIC INFORMATION.

Information concerning wrecks, derelicts, ice, and other dangerous obstructions to navigation, whenever received from the Hydrographic Office or from a branch hydrographic office or other reliable source, is sent broadcast four times daily, viz., at 8 a.m., noon, 4 p.m., and 8 p.m., local (standard) time of station. Ships within range of a naval radio station should be prepared to receive these hydrographic messages at the hours mentioned and should avoid sending radio messages at these times. One vessel sending may prevent several others receiving information necessary to their safety.

Naval radio stations will furnish this information to passing vessels on request, whenever practicable, at other hours than those mentioned above. Should it not be practicable to send out this information at one of the hours scheduled it will be held until the next scheduled time and sent out as soon as practicable after each hour scheduled.

Each day at noon and at 10 p.m., seventy-fifth meridian, immediately following the time signal, the naval radio station at Washington, D.C., will send broadcast such information relating to safe navigation as may be furnished it by the Hydrographic Office during the preceding 24 hours. The same wavelength, 2,500 metres, used in the time signal will be employed.

INTERNATIONAL ICE OBSERVATION AND ICE PATROL SERVICE.

For the purpose of carrying on the International Ice Observation and Ice Patrol Service provided for by the International Convention for the Safety of Life at Sea, London, 1913-14, the U.S. Coastguard cutters *Ossipee* and *Seneca* have been detailed for this service.

The object of the Ice Patrol Service is to locate the icebergs and field ice nearest to the transatlantic steamship lane. It will be the duty of patrol vessels to determine the southerly, easterly, and westerly limits of the ice, and to keep in touch with these fields as they move to the southward, in order that radio messages may be sent out daily, giving the whereabouts of the ice, particularly the ice that may be in the immediate vicinity of the regular transatlantic steam lane.

During the months of April, May, and June, and as much longer as necessary, these two vessels will obtain fuel and other necessary supplies at Portland, Me., and Boston, Mass., respectively. They will alternate on patrol, making alternate cruises of about fifteen days in the ice region; the fifteen days to be exclusive of time occupied in going to and from base. The movements of the vessels will be so regulated that on the fifteenth day after reaching the ice region the vessel on patrol will be relieved by the second vessel, if possible, at which time the first vessel will proceed to base, replenish her coal supply, and return in time to relieve the other vessel at the end of the latter's fifteen-day cruise. It is important that the patrol be continuous, and the vessel on patrol will not leave her station until relieved by the other vessel unless it is absolutely necessary to do so.

Having located the ice, the patrol vessel will send the following daily radiograms. All time in radiograms will be in 75th meridian time.

- (a) At 6 p.m. (75th meridian time) ice information will be sent broadcast for the benefit of vessels, using 600 metre wavelength. This message will be sent three times, with an interval of two minutes between each.
- (b) At 4 a.m. (75th meridian time) a radiogram will be sent to the Branch Hydrographic Office, New York City, through the nearest land radio stations, defining the ice danger zone, its southern limits, or other definite ice news. The telegraphic address of the Branch Hydrographic Office is "Hydrographic, New York."
- (c) Ice information will be given at any time to any ship with which the patrol vessel can communicate.

Ice information will be given in as plain, concise English as practicable, and will state in the following order :—

- (a) Ice (berg or field).
- (b) Date.
- (c) Time (75th meridian time).
- (d) Latitude.
- (e) Longitude.
- (f) Other data as may be necessary.

While on this duty the patrol vessel will endeavour by means of daily radio messages to keep ships at sea advised of the limits of the ice fields, etc.

The radio messages from the patrol ships will be given publicity immediately upon their receipt by the Branch Hydrographic Office, New York, and by the Hydrographic Office, Washington, D.C.

TRANSMISSION OF WEATHER REPORTS BY NAVAL RADIO STATIONS.

Through co-operation with local offices of the United States Weather Bureau, weather forecasts are sent broadcast to sea through naval coast radio stations at certain times, varying with the locality. Coast stations are generally prepared to give local forecasts to passing vessels without charge, on request. Storm warnings are sent whenever received.

GENERAL REPORT.

A general report of weather conditions in America is understood to be issued or about to be issued twice daily from Annapolis (17,000 m.) at 0130 and 1330 G.M.T.

ATLANTIC COAST AND GREAT LAKES.

Daily weather bulletins are distributed by the naval radio stations at Washington, D.C., and Key West, Fla., a few minutes after the 10 p.m. time signal. These bulletins consist of two parts.

The first part contains code letters and figures which express the actual weather conditions at 8 p.m. (seventy-fifth meridian time), on the day of distribution, at certain points along the eastern coast of North America, one point along the Gulf of Mexico, and one at Bermuda.

The second part of the bulletin contains a special forecast of the probable winds to be experienced a hundred miles or so offshore, made by the United States Weather Bureau for distribution to shipmasters. The second part of the bulletin also contains warnings of severe storms along the coasts, whenever occasion arises.

Immediately following this bulletin, a weather bulletin for certain points along the Great Lakes is sent broadcast by the naval radio station at Washington, D.C., and by Great Lakes (NAJ). The first part contains code letters and figures which express the actual weather conditions at 8 p.m. (seventy-fifth meridian time), on the day of distribution at certain points along the Lakes. The second part of the bulletin contains a special forecast of the probable winds to be experienced on the Lakes.

The points for which weather reports are furnished are designated as follows: *For Atlantic coast and Gulf points*, S=Sidney, T=Nantucket, DB=Delaware Breakwater, H=Hatteras, C=Charleston, K=Key West, P=Pensacola, B=Bermuda; *for points on the Great Lakes*, Du=Duluth, M=Marquette, U=Sault Ste. Marie, G=Green Bay, Ch=Chicago, L=Alpena, D=Detroit, V=Cleveland, and F=Buffalo.*

All bulletins begin with the letters U S W B (United States Weather Bureau) and the weather conditions follow. The first three figures of a report represent the barometric pressure in inches (002=30.02); the next figure, the fourth in sequence, represents the direction of the wind to the eight points

of the compass : 1 = north, 2 = north-east, 3 = east, 4 = south-east, 5 = south, 6 = south-west, 7 = west, 8 = north-west, and 0 = calm. The fifth figure represents the force of the wind on the Beaufort Scale.

In order to simplify the code, no provision has been made for wind force greater than 9, strong gale, on the Beaufort Scale. Whenever winds of force greater than 9 occur, the number representing them is given in words of figures, thus : Ten, eleven, etc.

Examples of Code.

PACIFIC COAST

Weather bulletins are obtained from the Weather Bureau, San Francisco, by the San Francisco Naval Radio Station at about 8.30 a.m. and 6 p.m., and forwarded by radio to North Head and San Diego as soon as practicable. They are broadcasted by San Francisco, North Head, and San Diego at noon and 10 p.m. on 952 metres immediately after transmission of time signals. Hydrographic information and storm warnings are broadcasted immediately upon receipt by Tatoosh. Puget Sound, North Head, Marshfield, San Francisco, and Point Arguello on 600 and 952 metres in succession, and also after broadcasting local weather report. Local weather reports broadcasted by Tatoosh, North Head, San Francisco and San Diego at 8 a.m. and 4 p.m. on 600 metres

and at noon and 10 p.m., 952 metres; and at noon and 10 p.m., by Puget Sound, Marshfield and Point Arguello on 600 meters. Weather report from Farallones Islands is forwarded to San Francisco for Marine Exchange at 8 a.m., noon, and 5 p.m.

The daily bulletin broadcasted by San Francisco, North Head, and San Diego will consist of two parts as for Atlantic coasts.

The points on the Pacific coast from which weather conditions will be furnished are—

T=Tatoosh.
NH=North Head.
E=Eureka.
SF=San Francisco.
SD=San Diego.

The bulletin will begin with the letters U S W B S F, signifying United States Weather Bureau, San Francisco, and the weather conditions will follow in the same code as for Atlantic coasts.

If the weather conditions for any station cannot be supplied, the initial of the station will be given, followed by the word "Missing"; and if any portion of a report cannot be furnished, such portion will be replaced by an equivalent number of letters, X.

The coast line of the western part of the United States will be divided as follows:—

Northern Pacific, Tatoosh to Cape Blanco.
Central Pacific, Cape Blanco to Point Arguello.
Southern Pacific, Point Arguello to San Diego.

The forecast and warning will be in ordinary language, and will cover a period of 24 hours from 5 p.m., date of issue. At the end of the forecast a statement will be made in regard to the location and movement of any barometric depression that may be likely to affect the winds over the ocean.

Example of forecast and warnings:

Northern Pacific missing Central Pacific Wednesday rain heavy southeast winds Southern Pacific moderate southerly winds period Southeast storm warnings displayed Pointarguello to Capeblanco.

PANAMA (CANAL ZONE).

Hydrographic information and weather reports, when received, are broadcasted immediately after 5 a.m. and 1 p.m. time at Balboa (NBA) on 7,000 metres (arc) and by Colon (NAX) on 1,500 metres (spark). At 5 a.m. Balboa (NBA) also broadcasts this information on 2,400 metres spark.

In addition to above, hydrographic information and weather warnings are broadcasted for ships in the Atlantic by Colon (NAX) and, for ships in the Pacific, Cape Mala (NNT), on 600 metres, immediately after receipt and at 8 a.m., noon, 4 p.m., and 8 p.m. (75th meridian time).

RADIO COMPASS STATIONS.

Radio compass stations have been installed on the Atlantic coast for the purpose of supplying vessels with bearings and positions. These stations are divided into two classes—those operating independently, and others, called harbour-entrance stations, operated under the control of a central control station at harbour entrances in order to guide vessels to the entrance buoys. The independent stations have been located with a view to giving good cross bearings to ships which are not over 150 miles distant from the coast, while the harbour-entrance stations have been located with a view to furnishing vessels with positions when they are within 50 miles of the entrance to the outer channel.

Harbour-entrance radio compass stations differ from those acting independently in that they are connected to and controlled by a central control station.

International Time and Weather Signals

INSTRUCTIONS CONCERNING RADIO COMPASS STATIONS

1. There follows a list of harbour-entrance radio compass stations.

Harbour entrance.	Compass-control station.
Boston, Mass.	Boston
New York, N.Y.	New York
Delaware Capes	Cape May
Chesapeake Capes	Virginia Beach

The following radio compass stations take bearings for Boston.

Place.	Latitude.	Position.
Gloucester, Mass.	42 35 19 N	7
Deer Island, Mass.	42 21 15 N	7
Fourth Cliff, Mass.	42 09 40 N	7

The following radio compass stations take bearings for New York.

Place.	Latitude.	Position.
Fire Island, N.Y.	40 38 07 N	73
Rockaway Beach, Long Island	40 33 52 N	73
Sandy Hook, N.J.	40 28 12 N	73
Mantoloking, N.J.	40 01 30 N	74
Montauk, Long Island	41 03 09 N	71

The following radio compass stations take bearings for Cape May.

Place.	Latitude.	Position.
Cape May, N.J.	38 56 41 N	74
Cape Henlopen, Del.	38 47 26 N	75
Bethany Beach, Del.	38 32 45 N	75

The following radio compass stations take bearings for Virginia.

Place.	Latitude.	Position.
Hog Island, Va.	37 22 36 N	75
Smith Island, Va.	37 07 08 N	75
Cape Henry, Va.	36 55 16 N	75

- To obtain a bearing from independent radio compass stations bearings by means of a conventional signal given below. call include the other compass stations can be obtained by the same procedure with the exception that the compass stations should be called instead of the compass station.
- When bearings are requested simultaneously from two or more stations the compass station which is farthest north will supply the bearing.

INSTRUCTIONS CONCERNING RADIO COMPASS STATIONS.

There follows a list of harbour-entrance radio compass stations :

Harbour entrance.	Compass-control station.	Radio call.
Mass.	Boston	NAD
N.Y.	New York	NAH
Capes	Cape May	NSD
the Capes	Virginia Beach	NCZ

The following radio compass stations take bearings for Boston :

Place.	Position.	
	Latitude.	Longitude.
	° ' "	° ' "
r, Mass.	42 35 19 N	70 41 08 W
nd, Mass.	42 21 15 N	70 57 30 W
iff, Mass.	42 09 40 N	70 42 22 W

The following radio compass stations take bearings for New York :

	° ' "	° ' "
d, Va.	37 22 36 N	75 42 37 W
nd, Va.	37 07 08 N	75 53 42 W
ry, Va.	36 55 16 N	75 59 51 W

To obtain a bearing from independent radio compass stations, call the from which the bearing is desired in the usual manner and request s by means of a conventional signal given below. Simultaneous s from two or more compass stations can be obtained by making the ude the other compass stations desired.

To obtain bearings from harbour-entrance compass stations carry out e procedure with the exception that the compass-control station e called instead of the compass station.

When bearings are requested simultaneously from two or more compass the compass station which is farthest north will supply the ship with

NN

its bearing first; the others will then follow in the order of their north to south, or east to west, geographical location.

5. The following abbreviated signals will be used until further notice :

Signal.	Meaning.
QTE ?	What is my true bearing ?
QTE	Your true bearing is ——— degrees from ——— radio compass station.
QTF ?	What is my position ?
QTF	Your position is latitude ———, longitude ———.

6. The radio compass station (or compass-control station for harbour-entrance compass stations) will answer requests for bearings and positions in the customary manner of answering calls and follow their call letters with " K " if they desire to take a bearing at that time, " QRX " if they desire the vessel to stand by, or other abbreviated signal authorised by International Regulations.

7. On being told to " K " vessels desiring bearings or positions will transmit their radio call letters for 30 seconds and then make dashes 5 seconds long for 1 minute, making their call letters 3 times after each 5-second dash and terminating with the conventional signal " K " (go ahead).

8. At the expiration of the direction-determining signals the radio compass station (or compass-control station) will call the vessel, make " QTE," and send the bearing in degrees (0 to 359) and the name of the compass station which obtained the bearing, or " QTF " and the position in latitude and longitude. Bearings and positions will always be transmitted to the vessel in words to avoid error.

9. Vessels acknowledge receipt of bearings and positions by making the call letters of the station transmitting the bearing or position once, " DE," vessel's radio call letters, and then repeats the bearing or position received, using numerals.

10. Independent radio compass stations keep watch on 800 metres spark, and this wavelength should always be used to call these stations.

11. Merchant vessels will call all radio compass and compass-control stations on 800 metres and carry out all tests and communication with them thereafter on this wavelength.*

12. Commanders of vessels should note that shore radio compass stations cannot distinguish between the bearing of a ship and its reciprocal unless the reciprocal bears inland. There is, therefore, a possibility of an error of 180 degrees. In such cases the decision is left to the commander of the ship as to which is the correct bearing.

13. Subject to the foregoing, bearings should be accurate within 2 degrees of arc. When bearings from three or more compass stations are not over 2 degrees of an arc in error, but do not meet at affixed point, the centre of an area enclosed by the bearings can generally be taken as the approximate position of the vessel.

14. The following U.S. naval shore radio compass stations are now in operation for the purpose of furnishing bearings to vessels in the West Atlantic :

Radio Compass Station.	Radio Call.	Position.
Gloucester, Mass.	.. NAD	Lat. 42° 35' 19" N Long. 70° 41' 08" W
Deer Island, Mass.	.. NAD	Lat. 42° 21' 15" N Long. 70° 57' 30" W
Fourth Cliff, Mass.	.. NAD	Lat. 42° 09' 40" N Long. 70° 42' 22" W
Cape Cod, Mass. NAE	Lat. 42° 02' 58" N Long. 70° 04' 32" W
Surfside, Nantucket, Mass.	NBS	Lat. 41° 14' 42" N Long. 70° 05' 56" W
Price's Neck, R.I.	.. NAF	Lat. 41° 27' 06" N Long. 71° 20' 15" W
Watch Hill, R.I.	.. NAF	Lat. 41° 18' 21" N Long. 71° 51' 29" W

* On and after April 1st, 1920, the 800-metre wavelength and no other will be used by all United States Naval shore radio compass stations.

Radio Compass Station.	Radio Call.	Position.
Montauk, L.I.	NAH	Lat. 41° 03' 09" N Long. 71° 57' 27" W
Fire Island, N.Y.	NAH	Lat. 40° 38' 07" N Long. 73° 12' 32" W
Rockaway Beach, N.Y.	NAH	Lat. 40° 33' 52" N Long. 73° 52' 40" W
Sandy Hook, N.J.	NAH	Lat. 40° 28' 12" N Long. 74° 01' 06" W
Mantoloking, N.J.	NAH	Lat. 40° 01' 30" N Long. 74° 03' 10" W
Cape May, N.J.	NSD	Lat. 38° 56' 41" N Long. 74° 53' 10" W
Cape Henlopen, Del.	NSD	Lat. 38° 47' 26" N Long. 75° 05' 16" W
Bethany Beach, Del.	NSD	Lat. 38° 32' 45" N Long. 75° 03' 20" W

Smith Island, Va.	NCZ	Lat. 37° 07' 08" N Long. 75° 53' 42" W
Cape Henry, Va.	NCZ	Lat. 36° 55' 16" N Long. 75° 59' 51" W
Cape Hatteras, N.C.	NDW	Lat. 35° 14' 22" N Long. 75° 31' 42" W
Cape Lookout, N.C.	NAN	Lat. 34° 36' 13" N Long. 76° 32' 15" W
Morris Island, S.C.	NAO	Lat. 32° 41' 33" N Long. 79° 53' 15" W

NOTE.—The following radio compass stations are temporarily out of commission: Fourth Cliff, Mass.; Cape Cod, Mass.; Surfside, Nantucket, Mass.; Price's Neck, R.I.; Watch Hill, R.I.; and Rockaway Beach, N.Y.

Where two or more of the foregoing compass stations have the same radio call it indicates that they are connected by wire telegraph to and under the control of a central control station, the radio call being the call of the central control station. When a request for bearings is made the central control station invariably answers with a bearing from each of the compass stations under its control.

URUGUAY

The Station of Cerrito radiates each day (excepting Sunday) between 10 p.m. and 11 p.m. (Greenwich mean time) a radiotelegram, issued by the International Meteorological Institute which contains the following information;

(a) The situation of centres of atmospheric movement in the southern part of the Continent in the zone between latitude 22° and the extreme south.

(b) Observations made at 12.20 p.m. (Greenwich mean time) by the Central Observatory at Monte Video and by stations of the National Service.

(c) The most important changes observed between 12.20 and 9 p.m. (Greenwich mean time).

NOTE.—For the wording of this radiotelegram the International Meteorological Telegraph Code will be used.

THE TECHNICAL PROGRESS OF RADIOTELEGRAPHY AND RADIOTELEPHONY IN CANADA DURING 1920

BY PROFESSOR A. S. EVE.

UNDER protection of the Canadian Patent granted to General G. O. Squier practical tests of guided waves (wired wireless) were made in May, 1919, between Toronto and Dundas, Ontario, by Dr. L. De Forrest, Dr. C. A. Culver and others.

On a busy circuit of the Ontario Hydro-Electric Telephone System two two-way wired wireless channels were superimposed without interference, the frequencies varying from 18,000 to 39,000, and even 500,000 were successful.

Similar trials did not interfere with a duplex printing telegraph system in operation between Toronto and Montreal. It appears probable that six two-way guided-wave telephone channels may be simultaneously operated over the usual circuit, in addition to the customary use of the line.

Under the Radiotelegraph Branch of the Canadian Naval Service there are—

Coast stations	44
Direction finding stations	3
Government ship stations	51
Licensed ship stations	145
Commercial stations	13
Experimental stations	9
Amateur stations	281

Some of the coast stations are operated by the Radiotelegraph branch of the Canadian Naval Service, and others, under contract, by the Marconi W/T Company of Canada.

The Government owned and operated station at Barrington, N.S., is fitted with $5\frac{1}{2}$ kw. and 10 kw. Marconi spark set and a 25 kw. Poulsen arc set. This station maintains a commercial service with Bermuda on 4,200 metres, C.W., and a long-distance commercial service with ships at sea.

The Marconi Station at Glace Bay maintains a well-operated transatlantic communication with Clifden, Ireland.

The Port Nelson Station is completed at Hudson Bay, and Mansell Island Station is half completed. Highly satisfactory results have been obtained with the three Government Direction Finding Stations at Cape Race, Newfoundland, at Canso, Nova Scotia, and at Chebucto Head, Nova Scotia. Two additional D.F. Stations will be erected this year, one on the Atlantic, the other on the Pacific coast.

The Marconi Company's transatlantic service has been improved by the installation of Franklin aerials at the Louisburg receiving station,

The six 300-foot steel masts have now been replaced by two of wood, only 180 feet in height, separated by a distance equal to a quarter of a wavelength (6,000 metres), and in a direct line with the transmitting station at Clifden. From each of these masts is suspended a pair of triangular loop aerials, in planes at right angles to one another, as employed at D.F. stations. With the new arrangement at Louisburg, interference from six directions, including that of the transmitter at Glace Bay, 12 miles distant, is successfully balanced out, as are also horizontal static disturbances from these directions, and vertical static disturbances.

Canada's rapidly expanding merchant fleet creates a demand for ship installations and has led to the development of new apparatus, notably a "panel" transmitter embodying several novel features. In this set provision is made for the transmission of minimum, medium, or maximum power on any one of three commercial wavelengths, the simple rotation of a switch and wheel automatically effecting the necessary changes in the respective circuits. About forty ships were equipped by the Marconi Company with various types of apparatus during the period under review.

Considerable attention has been devoted to wireless telephony. Demonstrations of the Marconi system in British Columbia have resulted in its adoption by the Provincial Government Forestry Department, for communication between Vancouver, Van Anda, Thurston Bay, and several river launches employed in forest patrol work. Reports to date indicate that wireless telephone, by providing a ready means of warning, is proving an invaluable aid in the protection of forests from fire, and there is every likelihood of its being widely used for this purpose in the near future. In Ottawa, during May, 1920, the writer delivered an illustrated lecture on "Some Inventions of the Great War" before a meeting of the Royal Society of Canada. The lecture dealt particularly with progress in wireless telegraphy and telephony, and, thanks to the co-operation of the Department of the Naval Service and the Marconi Wireless Telegraph Company of Canada, the audience was entertained with music and speeches transmitted by radiotelephone from the company's plant in Montreal, over one hundred miles away. The demonstration gave great satisfaction, in spite of the fact that the improvised receiving station was located in the centre of a highly electrified city and had no screening to eliminate the ether disturbance inherent to such conditions. During the following month, the scene of wireless telephone activity was moved to Winnipeg, where very satisfactory tests were made with Marconi apparatus between the city and Portage la Prairie. Again were demonstrated the wonderful possibilities of the wireless telephone as a connecting link between large Canadian centres and outlying towns which are either subject to isolation through the effect of storms, forest fires, and so forth, or are prevented from enjoying line-telephone connection through the prohibitive expense involved. The most important radiotelephone event of the year, however, was associated with the visit to Canada of the Imperial Press Delegation, when the s.s. *Victorian*, which carried the delegates, was kept in telephonic touch with shore throughout the voyage from England. Arrangements for communicating with the vessel from the Newfoundland side were entrusted to the Canadian Marconi Company, who conceived the

happy idea of erecting their apparatus on the scene of Mr. Marconi's first startling transatlantic experiment in 1901—Signal Hill, St. John's. The installation was of a temporary nature, and considerable difficulty was encountered in obtaining a satisfactory "earth" connection, but, notwithstanding these drawbacks, communication with the *Victorian* was established at a thousand miles, so that the Imperial Press delegates were able to speak from mid-Atlantic to the English or Canadian shore at will. Excellent speech was also heard at St. John's on this occasion from Chelmsford, England. Wireless telephone tests and demonstrations have been carried out since at various points, notably at Toronto National Exhibition, in September.

At the time of writing, public announcement is made of the union of the Canadian Marconi Company with the radio interests of the Canadian General Electric Company, one important result of this combination being that the Canadian Marconi Company will acquire the use of the valuable patents of the Canadian General Electric Company, including those covering the Alexanderson Alternator.

THE TECHNICAL PROGRESS OF RADIOTELEGRAPHY IN CHINA DURING THE YEAR 1920

BY F. E. ROBINSON.

The progress of Radiotelegraphy in China has been somewhat hampered owing to the unsettled state of the Government, but in spite of this a fair amount of progress has been made. Three Marconi 25 kw. arc stations are under construction, at the following places: Urga, the capital of Mongolia, Urumsti and Kashgar in Eastern Turkestan. The station at Urga will be completed at the end of October of the present year, it is expected that the remaining two stations will be completed at the end of 1921.

The Chinese National Wireless Telegraph Company, a joint concern of the Chinese Government and Marconi's Wireless Telegraph Company of London, has under construction a factory at Shanghai, which will be ready to undertake the construction of wireless telegraph apparatus by about April, 1921.

A National Research and Testing Laboratory is being instituted by the Chinese Government in Peking. The laboratory will be fitted up with all the latest instruments and apparatus required for research work in Radiotelegraphy. Four students have been sent to the Marconi works in England to study Wireless Telegraphy.

The Ministry of War has formed a Wireless Telephone Signal Corps which is officered entirely by Chinese military officers. This Signal Corps saw active service during the late trouble and proved its usefulness when the telephone and telegraph wires were cut.

There is no doubt that there is a big field for Radiotelegraphy in China, and it is expected that rapid strides will be made as soon as the country is under a stable government. Apart from Government enterprise, Chinese business men will instal Wireless Telephone sets in various cities in the provinces.

Probably during the coming year practical results will show up,

most of the work during 1920 being in the nature of spade work, as Radiotelegraphy has been rather neglected in China during the five years of the European War.

THE TECHNICAL PROGRESS OF WIRELESS TELEGRAPHY IN FRANCE DURING THE YEAR 1920

BY MARIUS LATOUR.

THE Wireless Station Lafayette, the most powerful in the world, a remarkable manifestation of the French-American friendship, was completed in 1920. It owes its origin to General Pershing's request that uninterrupted communication should be maintained between the expeditionary forces engaged in Europe and the United States. The importance of this demand was realised and resulted in the initiation, in 1917, of the Lafayette Station at Croix d'Hins, near Bordeaux.

The results obtained at the Lyons Station, which at the time of the discussion of the new project were rapidly helping to improve the newly established communication between France and the United States, gave French military Radiotelegraphy a basis from which to determine the main characteristics of the new installation. The anticipations foreshadowed at that date have been fully justified.

The United States could deliver towers 250 metres high and arc converters of 1,000 kilowatts as well as all the necessary accessories. The American Navy has accordingly taken charge of the installation of this material. To the French Military Service was entrusted the construction work, the erection of the buildings, the laying of the foundations of the towers and the carrying out of all the technical work relating to the antenna and grounding. A place was reserved in the buildings for a high-frequency 500 kilowatts machine of French construction, which could not be made available as quickly as the arc.

Official tests carried out by the American Navy between the 20th of August and the 20th of September have shown that the signals sent out from the Lafayette station could be received all over the world and with an intensity surpassing that of all other existing stations.

The horizontal antenna used at Croix d'Hins is supported on 8 towers 250 metres high of the well-known Arlington type. The towers are placed in two rows, separated by 400 metres of intervening ground, and are spaced 400 metres apart. The antenna capacity is 0.050 mf. ; its proper wavelength is around 8,400 metres. The normal working wavelength is in the neighbourhood of 23,500 metres.

The arc supplied by the Federal Co. is of the type described in the Proceedings of Radio-engineers. It permits a very accurate regulation of the magnetic field and is of robust construction.

The total resistance of the antenna is now near 1 ohm 5. Under ordinary conditions the antenna current reaches and even surpasses 500 amperes with a voltage slightly superior to the normal voltage of the exciting dynamo. The insulation of the antenna is

perfectly insured by means of porcelain insulators of American manufacture.

In the course of construction very interesting measurements were carried out. They will undoubtedly throw considerable light on the question of antenna losses.

The Lafayette Station is not yet completed. The French are continuing the work: a 500 kilowatts alternator of the Société Française Radioélectrique will be installed, and is expected to be in operation in 1921. The antenna current will be increased.

Referring to the reception of radio signals in 1920, the investigations were directed, on the one hand, towards improvements of communication between different stations by means of amplifiers of high resonance based either on the regeneration principle or on the use of a number of selective stages on the high and low frequency sides.

On the other hand, different systems for the elimination of static disturbances were tried out, with the result that *uninterrupted* communication between America and France could be made possible. An antenna input of 200 kw. in the American stations would be sufficient at a speed of 40 words per minute.

The photographic method of registering the signals at greater speed was developed to a point where the reception of several hundred words per minute was rendered practical. The energy consumed by the registration of 200 words per minute is of the order of ten microwatts.

TECHNICAL PROGRESS OF RADIOTÉLEGRAPHY IN GERMANY IN 1920

BY DR. ENG. A. MEISSNER

IN the first months of 1920 wireless telegraphy was influenced by the restrictions of the Peace Treaty, and only after April, 1920, could regular long distance radiotelegraphy be taken up, especially with America. Through new agreements, communication with the great station of Marion, belonging to the Marconi Company in America (now the Radio Corporation of America) was secured. At the same time a new plant is being built on Long Island by the Radio Communication Company, to work according to the Telefunken principle of frequency doubling and to be used for wireless exchange with Germany. The great station at Eilvese, with a Goldschmidt Generator, is now solely in German hands.

It is of importance that the building of the new Telefunken station at Nauen is now finished. Nauen now possesses two antennæ, a spark transmitter of 100 kilowatts and three radio frequency alternators, two of which can be connected in parallel, each furnishing an antenna energy of 400 kilowatts, the third giving 130 kilowatts. One antenna can radiate two waves simultaneously.

It is generally assumed that shortly only high-speed telegraphy will be used by the high power stations; for that reason it has been found of great value to determine the best method of signalling and of regulating the frequency of the machine.

The solution of the signalling problem was already given by the solution of the principle of the high-frequency doublers. After the Telefunken Co. had, in 1911, solved the problem of generating hundreds or thousands of kilowatts of radio frequency energy by the action of a few kilowatts of direct current, there was no longer any difficulty in controlling the radio frequency by this direct current. With scarcely 10 amperes direct current, it is now possible to interrupt an antenna energy of 400 or more kilowatts in rhythm with the signals by a small relay. For this purpose two magnetised iron cores are used—constructed and inserted just like the normal doublers—connected in the primary circuit of the radio frequency machine (German Patent No. 303,094). By varying the direct current through the magnetising windings their self-inductance is altered and, therefore, the circuit is thrown more or less out of tune. Such an arrangement is also used for radiotelephony. In this way an antenna energy of 400 kilowatts can be controlled by the human voice. For this purpose an energy of not more than two kilowatts is necessary. This is obtained by several preliminary vacuum tubes and finally by two audio-frequency amplifying tubes each of $1\frac{1}{2}$ kilowatts capacity, connected in parallel.

In order to regulate the frequency of the high frequency generator over wide limits, that is, to obtain a continuous range of wavelengths, a special machine set is added. In this arrangement the motor of the radio-frequency alternator is mounted on the same shaft as an auxiliary direct current motor, the brushes of which are connected to the direct current side of a rotary converter; the converter is connected to the three-phase line voltage. Without entering into the theory, it need only be mentioned that it is possible (by changing the field excitation of the auxiliary motor) to regulate the frequency of the driving motor from synchronism to zero, whilst the turning moment remains almost constant. The size of the auxiliary motor and converters corresponds to the desired change of frequency. If, for instance, a change of frequency of 30 per cent. is desired, the power of the auxiliary motor and converter must amount to about 30 per cent. of the power of the main driving motor. The regulation of the frequency is performed just as accurately and in the same way as in the case of a small direct current motor.

Besides this, another method of regulating the frequency has been employed to keep the frequency constant, in case the line voltage changes by a small amount if the load is changed over wide limits. The speed of the driving motor of the radio-frequency alternator may be changed by a variation of its field. Of course, the field of the motor may only be weakened to any great extent if the power output is simultaneously decreased, because otherwise the motor falls out of step. For radio-frequency transmitters the conditions are favourable for this method. If the circuit is closed, the frequency must be kept constant whilst the output is changed greatly, for in signalling the load on the machine varies between zero to full load. In practice a small decrease of the field strength is sufficient to obtain a constant frequency, even if the load is greatly decreased. To effect this regulation of the field by regulating the voltage, inductances are inserted into the supply leads of the three-phase motor. The windings of these coils are each divided into two parts, each of which is star connected. In this way the coils each have two neutral points. These points are

connected with a source of direct current, and, by changing the direct current magnetisation, the desired change of voltage of the motor is secured (German Patent, No. 276,283). By altering the direct current, the frequency is accurately regulated, and in addition the changes of the turning moment are compensated if the load on the machine rises from zero to full load in signalling.

New points of view have been developed for earthing high-power stations, the accuracy of which has been proved by experiments with models.

The reception at large stations is greatly improved by using directive reception and double heterodyne. Directive reception means reception from one single direction. If a frame antenna, which receives from two directions, is combined with an elevated antenna, a one-sided reception is obtained. This arrangement has proved up till now the best way of diminishing atmospheric disturbances—it is possible to reduce the disturbances in the ratio 1:4—and disturbances by high-power stations in the proximity of the receiver. Besides this, the receiving waves may be chosen nearly the same as that of the sender. The waves of the transmitter and receiver may even be identical, if the local arrangement is appropriate. If double heterodyning (German Patent, No. 300,896) is employed, an inaudible beat frequency of 6,000 to 10,000 cycles is first generated. After rectification of these beats, the currents of this frequency are strengthened by radio-frequency amplifiers, and then a second heterodyne is applied so that an audible frequency is produced. This double “superposition” is specially important for eliminating disturbing stations. For the same purpose tuned circuits are adjusted to give acoustic resonance. For receiving, a Morse printer is often employed. Through several improvements of reception it has now become possible to keep up continuous wireless communication with America throughout the twenty-four hours. Recording is possible for half the time.

For European communication all the spark sets were replaced by tube oscillators, and the first larger types (10 kilowatt in the antenna) were set going. Several tubes are connected in parallel, and the largest furnishes about 2 kilowatt antenna energy. In a short time still larger types will be constructed. Difficulties arose at first in operating large tubes in parallel. Short disturbing waves occurred through the large capacities between the various parts of the tubes, especially those between grid and anode. Waves of less than 1 meter wavelength have been observed. After the reason of their existence had been discovered, simple means were soon found to avoid them. The large tube oscillators operate with independent grid excitation, and with or without intermediate circuit.

Königswusterhausen, near Berlin, is now the chief station in Germany for European communication (with Spain, Sweden, Norway and the Eastern countries). Königswusterhausen is at the same time the central station for radiotelegraphy within Germany. For this purpose a number of one kilowatt tube oscillators have been put up each having a separate smaller antenna. The following communication routes in Germany have been put into operation recently: Berlin—Frankfurt a/m; Berlin—Darmstadt; Berlin—Dortmund; Berlin—Düsseldorf; Berlin—Hanover; Berlin—Hamburg; Berlin—Königsberg; Berlin—Stettin and Berlin—Breslau.

Duplex communication is used. The single receivers are 20 km. apart and are often furnished with high speed apparatus. Königswusterhausen supplies the quickest news to the press; in six months' time radiotelephony will be used. For this purpose quite simple types of receivers (press receivers) were constructed, which are appropriate for receiving one single wave, similar to the receivers for time signals. The development of radiotelegraphy for navigation has only made very little progress; herein the further development is prevented by the Peace Treaty. In spite of this, several attempts have been made to introduce directive transmitters and receivers, and calling devices, all of which are dependent on the cathode relay principle (German Patent, No. 300,013).

Whilst the small F.T. station (10-20 Watt) have almost disappeared from use—there are scarcely any aeroplanes left in Germany—they are used in wire telegraphy and telephony, firstly for telephony along the high voltage lines of power distributing systems, secondly in telegraphy and telephony along the land lines of the post office. Several "wired-wireless" installations of 50 to 150 kms. in length are in use on high voltage transmission lines—for instance, one along the 135 km. 100,000 volts line from the power station at Golpa to Berlin. It has become more and more obvious, that the only possibility of sure communication between the high voltage power station and the sub-stations is by radio-frequency telephony, for the many attempts which have been made with special wires for ordinary telephony along the high voltage land line routes have given no satisfactory results. The latter method of communication suffers by the disturbances of the high voltage, especially by the noises of the 50 period generators, and besides, this kind of telephony is a continual danger for the attendant. Very simple solutions have been found for the coupling of the radio-frequency apparatus so that the attendant is in no way endangered. Either the energy of the transmitter is transferred to the high voltage from antennæ of 50 to 100 metres in length, which are adjusted parallel to these wires, or the transmitter is directly connected with the high voltage wires through small high voltage condensers (of 100 to 200 cms. capacity).

Multiplex wired wireless telephony along the post office wires has made essential progress during the last year. Besides the numerous laboratory transmitters, the first commercial transmitters and receivers are now being used, and an exchange with more than 100 transmitters and receivers is being built. On the Berlin—Hanover; Berlin—Frankfurt a/m and Berlin—Stralsund lines more than 120 conversations of 3 minutes each have often been transmitted on each radio-frequency connection in 8 hours daily. According to the post office account the speech transmission is good. The audibility was adjusted to be the same as in the ordinary method of communication. The radio-frequency conversations were not disturbed by noises on the lines, and whilst the normal telephony often was obliged to be stopped because of too loud noises, the radio-frequency connection was in full action.

The three-fold high speed telegraphic line Berlin—Frankfurt a/m (600 km.) has also answered very well. Although the laboratory apparatus is still used, more than 4,000 words a minute have often been telegraphed. This is a maximum efficiency which has up till now never before been reached; it means a daily transmission of 16,000

telegrams, consisting of 10 words of 6 letters each, in 8 hours working time supposing that only half of this time is used for telegraphing.

The numerous published articles in German journals—*Jahrbuch für drahtlosen Telegraphie*, *Elektrotechnische Zeitschrift*—in the course of last year prove what great progress radio-telegraphy and telephony have made in Germany. The researches on amplifying and oscillating tubes are specially valuable. The many complicated questions which are contained in the problem of the sending and amplifying tubes and which were already solved by experiments, are now also theoretically fully explained—together with the problem of the audion reaction receiver. The latter is the most difficult, as herein all the sending and amplifying problems are combined and cannot easily be discerned. Through a new theory of the characteristic curves for oscillating tubes all the fundamental quantities are given which are necessary for the technical development.

THE TECHNICAL PROGRESS OF WIRELESS TELEGRAPHY IN ITALY DURING 1920

By COMMANDER GINO MONTEFINALE.

Chief of the Italian Navy W/T Laboratory, Spezia.

THE Radiotelegraph Laboratories of the Royal Arsenal at Spezia, the foundations of which were laid in 1897, immediately after the classic experiments made by Senatore Marconi in the waters of this maritime fortified town, were principally extended during the course of the great war both in order to meet the greater exigencies of Naval, Aerial and Colonial Radiotelegraphy, and in order to render aid to industrial radiotelegraph production. Whilst the majority of spark sets necessary for the various services continued to be purchased from the Marconi Company, which extended and perfected the National Laboratories of Genoa, the Laboratory of Spezia was specialising in the construction of continuous wave transmitting and receiving stations and especially in Poulsen arcs, a type of apparatus which, at a period when the transmitting valves had not attained to their present state of perfection, was found to be particularly suitable for the improvement of the radiotelegraph services entrusted to the Royal Navy and for the creation of new ones.

As a consequence of this, during the years subsequent to the Armistice and particularly this year, the Italian Government was able to complete the programme of installations previously decided upon between the Ministries of the Navy, of Posts and Telegraphs, and of the Colonies, with a sufficiency of apparatus which enabled it to make valuable contributions to the radiotelegraph communications of the Entente and of some of the minor States.

Towards the end of the year 1919, the International situation in trans-Caucasia and Southern Russia demanded the immediate installation of a high-power station at Constantinople to serve as an intermediate in the radioelectric communications between these regions and the principal western capitals. Italy was able to comply rapidly and efficiently and within a few months sent to the Golden Horn a floating radiotelegraph station constituted by an old unit of the Navy

suitably equipped for the purpose. Two Poulsen arcs of 25/50 kilowatts are used as continuous wave generators and are fed by powerful batteries of accumulators and Diesel generating sets taken from old hulls of submarines. The great aerial, of the multiple cage type, has a capacity of 0.003 mfd. and is traversed by oscillatory currents of the order of 45 amperes. Excellent communications were effected at a maximum distance of 2,000 nautical miles.

The good results obtained by this station induced the Roumanian Government to purchase from Italy a similar one which was installed in the premises of the Marconi station at Bucarest. This station, syntonised for the two waves of 7,200 and 20,000 metres, with an antenna current of 60 amperes, has worked excellently with Rome, Berlin, Massaua and Mogadiscio.

In June, 1920, contemporaneously with that of Bucarest, two great arcs of 150 kw. constructed at the Spezia works, were brought into service at Massaua. The project of this installation dated from 1916, but its execution was delayed by the difficulties of war and overseas transports. Notwithstanding the excessively hot climate of Massaua, little suited to the working of high-power arcs, this locality was selected in preference to another and colder place on the Erythrian Plateau, as there had already existed since 1910 a great Marconi spark station of 110 kw., the first high-power station to be erected on the Black Continent. Advantage could thus be taken not only of the same horizontal directional aerial, but also of the same electrical generators of the disc set. These in fact feed directly with alternating current the Marconi, or rather Poulsen station, by the interposition of suitable converter groups of 150 kw. capable of yielding continuous currents of 100 amperes at a potential of 900 volts. The spark station is tuned for a wave of 4,000 metres and the arc station is regulated for a wave of 8,000 metres. The adoption of the duplex receiving station of Asmara, also furnished with a horizontal directional aerial, new frame aerial receiving system and several valve amplifiers, effected a noteworthy improvement to the Rome-Massaua-Mogadiscio service, which now works with perfect regularity also for private and commercial communications, in competition with the Eastern Company's cables, constituting a classic example of long-distance communications by radiotelegraphy which, in our opinion, ought to have attracted more than others the attention of the Royal Commission for the British Imperial Wireless Scheme.

In September, 1920, a Poulsen arc of 50 kw. constructed by the Royal Navy was installed at the Marconi station of Coltano in order to feed, in turn with the spark set, the horizontal directional aerial. In all the arcs mentioned, the hydro-carbon vapour is obtained by means of alcohol rather than with illuminating gas, it being injected into the electrode cases by means of a special device designed by the Royal Navy. The use of illuminating gas is henceforth restricted solely to the station of S. Paolo, Rome.

The most important work which is now being carried out in the radiotelegraph laboratories of Spezia is, without doubt, that of the two arc sets of 350 kw. destined for the new Coltano Radio which will feed a large new aerial supported by metal towers 250 metres in height and insulated at the base.

One of the most striking aspects of the progress in Italian radio-

telegraphy in 1920 is the decisive trend towards the adoption of the vacuum lamps, also for transmission. This is a direct consequence of the radiotelegraph and radiotelephonic experiments conducted in April, 1920, between Rome and Chelmsford, and of the demonstrations made by Senatore Marconi during the cruise of the yacht *Elettra*, in Italian waters.

A first Marconi Valve Station was erected on the new palace of the Ministry of the Interior, and renders one of the most valuable services, connecting the capital with all the prefectures of the kingdom. A second set was installed at the station of Centocelle exclusively for communications with the Naval Authorities and with the Islands. Other valve stations are in course of installation in Sicily and on some of the surrounding islands, thus providing the principal localities with the telegraph communication of which they were hitherto deprived, owing to the lack of submarine cables or the difficulty of their maintenance. In connection herewith studies are in progress to obtain the same end in some colonial zones for which powerful spark stations had been projected, but of which the difficulties of transport and the high cost of working had not admitted of their installation. An interesting experiment has now been made at a place in East Africa situate in an impervious and mountainous zone where a valve station of small power should render the same service for which a high-power spark station was projected.

In August, 1920, a 6 kw. Marconi Valve Station was brought into operation at Coltano for communications with Spain and England.

The considerable progress of radiotelegraphy in Italy is due, in addition to the extremely patriotic work of Senatore Marconi, who placed at the disposal of the Royal Government all the patents of his company, permitting their reproduction, also to the notable contribution of the larger scientific institutions. First amongst these is the Istituto Elettrotecnico e Radiotelegrafico of the Royal Navy, Leghorn, to the honour of which is not only the first complete technical treatment, but also the first practical elaboration of vacuum tubes in Italy, and notable comparative studies on molecular pumps and pumps with mercury condensation, using liquid air as a valuable subsidiary.

Then follow the Istituto R.T. Militare and the Istituto Superiore Posteografico of Rome, whilst the university institutions are gradually interesting themselves in radiotelegraph questions, chief of these being that of Naples, together with Milan and Turin.

TECHNICAL PROGRESS OF RADIOTELEGRAPHY AND RADIOTELEPHONY IN JAPAN DURING THE YEAR 1920

By EITARO YOKOYAMA,

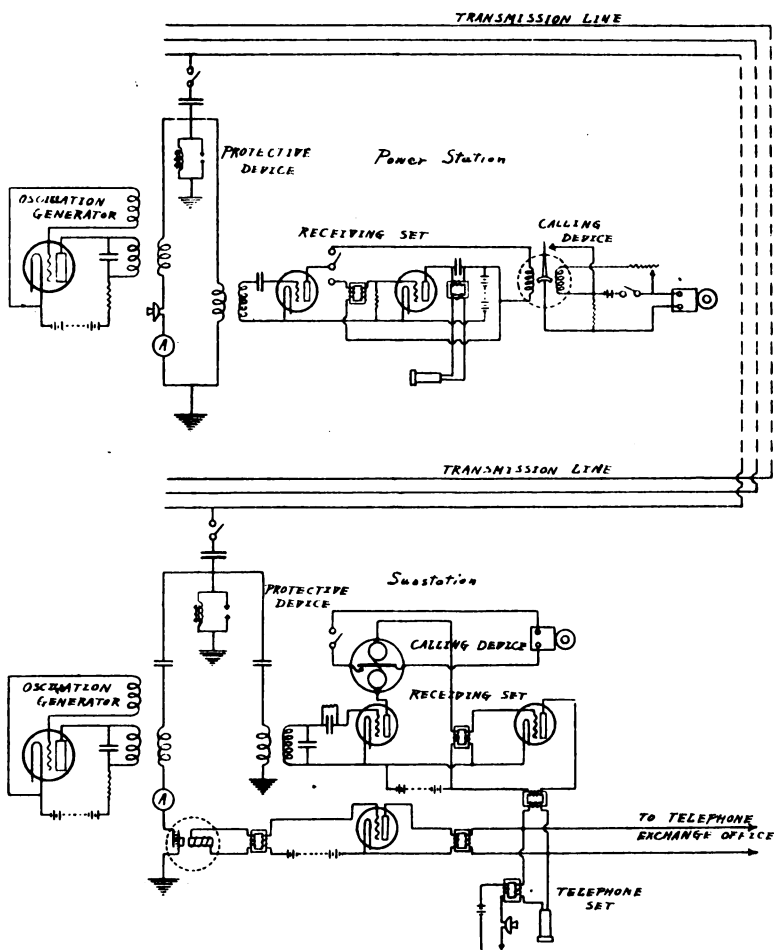

Superintendent of Radio Section, Electro-Technical Laboratory, Japan.

THE commercial radio frequency engineering researches in Japan during the year 1920 made little deviation from the ordinary routine of radiotelegraphy and radiotelephony which have been the main applications to radio frequency engineering. The latter relates essentially to the following three items:—

- (1) Wired Radiotelegraph over Battery Telephone Line.
- (2) Wired Radiotelephone over Power Transmission Line.
- (3) Connection of Wired and Wireless Telephones.

Concerning all these items, descriptions were made in the 1920 Year-Book by Dr. Wichi Torikata, and this *résumé* forms only a continuation, subsequent developments being briefly described.

A quite satisfactory experiment with wired radiotelegraphy over battery telephone line using three-electrode vacuum bulbs as oscillation

generator as well as receiver was first carried out at the end of 1917, and the system has been adopted between Tokyo and Osaka, 350 miles apart, since March, 1919. Constant attention has been paid to the improvement of the apparatus, especially the calling device, in even

its minutest points. Consequently, the result of the test will indicate whether a revolutionary change may take place in the system of electrical communication throughout Japan in the near future.

As to the application of wired radiotelephony to power transmission lines the first experiment over those of the Kinugawa Hydro-Electric Company and the second over those of the Fuji Hydro-Electric Company were referred to in the last Year-Book.

Mr. Marumo's paper on this subject in the June (1920) issue of the Proceedings of the Institute of Radio Engineers is worthy of perusal. As seen in the figure, condensers which are to be directly connected with transmission lines are an essential feature, and they have safely to stand under extra high tension of the lines. Such condensers are so expensive in price that it may make the whole system unsuitable for adoption by the electric power companies. A new method has finally been developed to overcome the above-mentioned difficulty, in which the high-tension condensers are entirely dispensed with. The third experiment has been successfully carried out at the Kinugawa Hydro-Electric Company with the new scheme since June, 1920. When transmission lines are struck by lightning, the battery telephone attached to transmission lines generally becomes out of order, and it follows that the important arrangement between power station and substation in this case of emergency is entirely useless, meanwhile the wired radiotelephony would not fail even in such a case. The transmission lines of the company are often damaged by frequent thunder storms, especially in the summer months, owing to the fact that the surroundings of the power station of the company near Nikko, are always the seat of severe atmospheric disturbances. The new system of wired radiotelephony has been excellently proved to be an ideal means of communication in transmission lines, the test having been continued throughout the lightning season of 1920. It is expected that the system will soon be adopted in electric power transmission practice.

Regarding the connection of wired and wireless telephones, a decisive test was carried out for about six months from February, 1920, at Kobe Harbour, after several preliminary experiments since 1917. A radiotelephone set was fitted on board the *Amerikamaru*, which is a Japanese-Formosan liner of 6,000 tons and comes into port every fortnight, and an exchange set of wired and wireless telephones was installed in the building of the Kobe Central Telephone Exchange Office. Clear and easy conversations were effected between the ship and wired telephone subscribers at Kobe, Osaka, and more distant cities. Plans are now being made to put the system to commercial use.

A further experiment is at present being carried on to enable any wired telephone subscribers of two different cities to converse with each other with telephone lines on both sides with wireless between. This is very useful in Japan for interisland telephonic communications, the telephony with a long submarine cable being difficult at the present time. The exchange offices for the experiment have been placed at Awomori harbour, the northernmost city of Japanese main island, and Hakodate harbour, the southernmost city of Hokkaido island. The two cities are sixty miles apart by sea.

In conclusion, it may be added that all the advancement mentioned above is largely due to the recent remarkable progress of vacuum bulbs, especially of transmitter bulbs, in this country.

THE TECHNICAL PROGRESS OF RADIO-TELEGRAPHY IN THE NETHERLANDS.

BY BALTH VAN DER POL, JUN., D.SC.,

Conservator of the Physical Laboratory, Teyler's Institute, Haarlem.

IN the account of the progress of wireless telegraphy and telephony in Holland which appeared in the 1920 Edition of this Year-Book we mentioned the increasing interest paid by Dutch scientists and engineers to the vast field of experimental and theoretical research in wireless telegraphy and electromagnetic waves in general. It is this scientific research of which we shall give a short résumé in this note.

Of course the wireless communication between Holland and her East Indian Colonies is of the utmost importance, and the success of such long-distance communication, now as triode amplifiers are in general use, is to a large extent depending upon the elimination of atmospherics. The use of a special earth-antenna developed by Mr. A. E. Vlug, of the Dutch Post and Telegraph Department, proved to be a success in this respect, as the ratio of the signal intensity to the intensity of strays is under circumstances more favourable with antennæ buried in the earth than with aerial systems. The reception of the signals from the Dutch East Indian Malabar Station appeared to be possible with these earth antennæ. Notwithstanding the great amount of experimental work done in this respect in various countries, a complete theory, which must take into account the conductivity and dielectric constant of the earth at the receiving spot, is still lacking though the important work of Zenneck and Von Hoerschelmann undoubtedly mark the first step in this respect.

Now that so many high-power stations are in use the difficulty is felt of preventing undesired signals to affect the receiving telephones. An improvement in this respect is obtained by using receiving systems having a small damping. But even then considerable trouble is experienced.

If, however, the apparent resistance for a given audible frequency is reduced as well, a considerable improvement in selectivity may be obtained. This idea is embodied in Dr. N. Kooman's Note-Magnifier. Between the ordinary telephone terminals of the receiving set and the phones a triode system is included having an audible frequency corresponding to the heterodyne note on which it is desired to receive the undamped signals. If by the well-known retroaction principle the apparent resistance for this particular beat note is reduced to nearly zero, the system is brought on the verge of oscillation with this audible frequency. Hence, of all audible oscillations, this particular one is magnified to a considerable extent resulting in a greater selectivity. Unfortunately, however, a practical limit to this mode of working is put by the finite time necessary for the oscillations to reach their definite amplitude, a time, which, as an elementary theory already shows, is the longer, the less the system is damped. And as this time is of the order of magnitude of the duration of the points and dashes of signalling, the reduction of the apparent resistance can only be carried to a certain degree. Nevertheless, the Kooman's tone magnifier proved to be a noteworthy improvement for obtaining selectivity.

Leaving for a moment the triode and its important applications, we find in a doctor thesis (1918) of Dr. M. J. Huizinga, entitled "De unipolaire geleiding van Kristaldetectoren," an interesting experimental contribution to our knowledge concerning crystal-detector. In particular, if a current is sent for some time through a molybdenite-metal detector, a small amount of a blue liquid is seen to appear at the contact spot containing various oxydes of molybdenum. During the passage of a circuit from molybdenite to the metal point very small gas-bubbles appeared in the liquid, thus indicating that some electrolytic action was taking place. As the deviations from Ohm's law are similar in the case where the blue liquid is visible under a microscope as in the case where it is not, and for other reasons, it is concluded that the detector action of such a crystal contact can be considered to be of electrolytic nature. Many characteristics of several other crystal detectors are plotted as well, which show a marked constancy, this being obtained by taking the series of measurements within as short a time as possible.

Turning again to the triode, we mention a valuable paper by Dr. D. Coster (Proc. Kon. Akadem. Amsterdam, Vol. XXI, No. 10, page 1), "On the use of the Audion in Wireless Telegraphy." A great many triode circuits are here described which enable self-sustained oscillations to be set up. A general theoretical treatment is given of the conditions which must be satisfied by the various electrical parameters of the circuit for oscillations to be generated. In order to simplify the analysis, as usual, only rectilinear triode characteristics are considered, but the treatment is of such a general nature that probably any known or even not yet "invented" circuit may come under these general cases.

In April, 1920, a doctor's thesis was presented by the present writer to the Utrecht University, entitled: "De invloed van een geïoniseerd gas op het voortschryden van electromagnetische golven en toepassingen daarvan op het gebied der draadloze telegrafie en by metingen aan glimlicht ontladingen." (Haarlem, 1920.)

In this thesis the great discrepancies between the theoretical magnitude of the wave amplitude at a big distance from a transmitting station with the one obtained experimentally are pointed out. Experiments are described where electromagnetic waves are caused to travel through tubes filled with rarified gases which are ionised by an independent glow discharge, thus imitating the state of the upper atmosphere. The experiments point to a decrease in apparent specific inductive capacity for the frequencies and ionic mobilities used, which is necessary to reconcile experimental and theoretical results with regard to the propagation of waves around the earth.

The increasing importance of the science of Wireless Telegraphy led to the establishment of a Dutch Scientific Radio Institute ("Nederlandsch Radio Genootschap"), May, 1920 (Address: Secretary: Utrecht, Willem Barentzstraat 8). This institute, which intends to be for Holland the centre of radio science, counts amongst its members most of the Dutch eminent physicists and radio engineers. The papers to be read at its meetings as well as other contributions will be published in the Proceedings of this Institute.

TECHNICAL PROGRESS OF RADIOTELEGRAPHY AND TELEPHONY IN NORWAY DURING 1920

BY COMMANDER B. L. GOTTWALDT, R.N.

THE year 1920 has not been specially remarkable as regards the development of new wireless stations coming under Government control. It seems as if the financial position in this country as in many other countries does not allow for the erection of larger wireless coast and land stations, although the authorities in charge of the Wireless Administration are doing their best by closely following the rapid progress of radiotechnics. The Telegraph Administration have, however, elaborated plans for linking up the whole country with land stations, as well as with coast stations, and special attention is paid to wireless communication between the northern part of the country and the capital.

Some interest has now been aroused in the wireless telephone problem, as the Telegraph Administration has erected two wireless telephone stations on the western coast of the country for wireless communication between the town Kristiansund and an island lying about ten miles to the westward of this place. As far as is known, these stations are working to the satisfaction of those concerned.

The Royal Navy have also taken a keen interest in the development of the modern wireless gear constructed for working on continuous waves with the well-known three-electrode valve transmitter. Several combined wireless telephone and telegraph stations have already been erected for the Military Service, and more stations are very likely to follow.

During the last year the Norwegian Parliament (*Storting*), have not issued any new wireless laws or regulations, most probably because they are awaiting the results of the new International Convention, which is to be held in Washington. The Telegraph Administration have not yet taken over any ship wireless stations in order to operate them on their own account, but this will now most certainly be done in the near future.

The restrictions imposed on wireless amateurs have not yet been relaxed, so there have been no activities in this respect either on the part of individual amateurs or of any wireless clubs, and this fact is certainly to be regretted.

The development of wireless telegraphy in the Mercantile Marine has progressed very rapidly owing to the new British Merchant Shipping Act for wireless telegraphy, which comes into force on the 1st of December, 1920, and also applies to foreign vessels.

At the beginning of 1920 there were about 150 ship stations installed on board Norwegian merchant vessels, and this figure will most probably be augmented to about 400 by the end of the year. All in all more than 450 vessels will have to be equipped with wireless installations in the near future, in order to conform to the new British regulations, and it seems as if at least about two-thirds of all the installations on board Norwegian vessels will be of the Marconi system, which thus still holds its predominant position in this country.

Wireless direction-finder stations have now been installed in

connection with the principal coast stations opened for International public correspondence. These D.F. stations are working on the usual normal wavelength of 600 metres, and are of the well-known Marconi-Bellini Tosi system with double loop aerials. Such stations are erected at Tjomoy, Flekkeroy, Utsire, Bergen and Ingoy Radio.

The Telegraph Administration have also plans for erecting smaller automatic radiophares at the most important ship-traffic entrances on the Eastern and Western coast, in order to enable vessels equipped with D.F. apparatus to take bearings themselves.

TECHNICAL PROGRESS OF RADIOTELEGRAPHY IN SPAIN DURING 1920

THE wide development of wireless communication in Spain gives clear evidence of the great attention which is paid in official and private centres in that country to this important branch of science.

The return of peace has allowed us to benefit from the improvements and recently developed devices which were kept secret during the war.

With reference to the Army, the small portable valve field stations, Type Z A 1, were tested with very successful results. These sets have already been in use by Spanish troops in Morocco, and have given full satisfaction.

The Army authorities are appreciating the advantages of valve stations, and have lost no time in obtaining several for the Telegraph Regiment and Wireless Field Battalion.

The Carabanchel station (Madrid), the largest permanent land station of the Spanish Army, has been improved by the addition of a Marconi 6 kw. telegraph and telephone valve set. The tests carried out with this set and a similar one recently fitted at Barcelona were remarkably successful. The speech from Carabanchel was also heard by the Army stations in Morocco.

During the important radiotelephone tests at Chelmsford, where Mme. Nellie Melba sang before the transmitting microphone, her voice was heard very clear at Carabanchel station.

The Navy Department is devoting the greatest attention to the direction finder. The erection of several direction-finding stations around the Spanish coast in order to assist navigation have already been decided for the very near future. Plans for the carrying out of this important service are being studied by the Naval authorities.

Arrangements have already been made for the fitting of a short-range wireless station in the Columbretes lighthouse for communication with a low-power station on the Spanish coast.

The Spanish Government has approved plans for the erection of two wireless telegraph and telephone stations, one in the Balearic Islands and the other in Valencia. These stations are intended to

supersede the existing cable. The contract for this scheme has been placed with the *Compañía Nacional de Telegrafía sin Hilos*, of Madrid.

Other schemes, among which may be mentioned the Aviation Service, are under consideration by the official authorities.

Special mention must be made of the *Compañía Nacional de Telegrafía sin Hilos*, the sole licensees for the carrying out of the wireless private service in Spain, which is performed by Marconi system stations at Aranjuez, Barcelona and other points of the coast.

Besides the ship service, that company is handling the Anglo-Spanish and German-Spanish traffic through the Aranjuez high-power station, while the Barcelona station is busy with traffic to Italy and Austria-Hungary.

The Aranjuez station was improved by the fitting of a 25 kw. arc transmitter, and the further installation of a valve transmitting set is contemplated for the near future.

The Barcelona station has also been provided with a 6 kw. valve equipment. Wireless telegraph and telephone tests have been recently effected with Carabanchel and Chelmsford using this set, with very satisfactory results. The conversation between Chelmsford and Barcelona was very easy and clear, which speaks highly in favour of the improvements brought about in valve work by the Marconi Company.

The Navy Department has already started to adopt valve instruments for the stations of the Spanish warships.

The Mercantile Marine is undergoing a period of remarkable activity and development, as is well evidenced by the large increase in the number of ships built in national and foreign shipyards for the Spanish register. As an obvious sequel, and, thanks to the adequate regulations issued by the Government, the field of maritime wireless has been considerably enlarged.

At the end of 1919, about 260 merchant ships carried wireless stations, and since the beginning of this year about 60 further ship stations have been already installed. There remains still a large number whose contracts for installation have been secured by the *Compañía Nacional*, and, with very few exceptions, all the stations of the Mercantile Marine are of the Marconi system.

The new ships of the *Compañía Trasatlántica* will be provided with the latest type of Marconi apparatus, including combined valve and spark transmitters, valve receiver, and direction finder.

As regards wireless amateurs, there are not many facilities for them. Nevertheless, the Government is encouraging true scientific students and investigators. The latest Royal Decree of 18th January, 1920, gives the regulations under which the wireless installations for scientific purposes are allowed to be erected. Provision is made to avoid interference with Government and public service stations.

The number of educational centres using wireless apparatus for teaching and testing purposes is increasing, and the demand for technical books on wireless shows the interest that has been aroused on the matter.

THE PROGRESS OF WIRELESS TELEGRAPHY AND TELEPHONY IN UNITED KINGDOM DURING 1920

BY E. V. APPLETON, M.A., M.Sc.

IN an attempt to gauge the progress of Radiotelegraphy and Telephony during the past year one is immediately confronted with the difficulty that many of the communications recently made by various workers have dealt with researches carried on in Service Departments during the war. Such work was of an intensive character, and, although two years have elapsed since the Armistice, the information gained in these researches has still not all been made public. If, however, the field under review is extended to include work either published or accomplished during the year a more definite pronouncement is possible, and one can unhesitatingly indicate as the two main features of recent advance the experimental work on Radiotelephony and the quantitative elucidation and design of triode valves with their associated circuits. But even though the progress made in these two directions during both the war and post-war periods has been distinctly phenomenal, the experience of the last year has shown decisively that much work is yet to be done before the short-distance communication maintained so successfully for war purposes can be copied over large distances for the commercial requirements of peace.

Considerable attention has been given to the increasing field of utility of Wireless Telegraphy and Telephony in aerial navigation. Wireless stations have recently been erected at Croydon, Lympne and Le Bourget (near Paris) for the purpose of maintaining communication with machines travelling along the London-Paris air route, and the magnificent achievement of maintaining a practically uninterrupted service of aeroplanes between Paris and London during the year is due in large part to the use made of Radiotelephony. On March 4th the first commercial machine (Handley-Page) fitted with a Wireless Telephony installation successfully accomplished the journey to Paris. The valve sets used were designed by the Marconi Company, and had as the main source of energy a high-tension generator driven by a small air screw working in the slip stream of the main propeller. Communication from land to machine and *vice versa* was maintained throughout the journey, the signals up to distances of 125 miles being quite clear and distinct. In order to render the co-operation of Radiotelephony and Aviation still closer and more effective it now only remains for a system of direction finding to be perfected in order to surmount what is practically the one outstanding problem of present-day flying—the successful landing of aircraft in foggy or hazy weather.

In long-distance land-to-land Telephony the Marconi Company achieved notable successes in the early part of the year. Satisfactory communication with Madrid was established in January with a 6-kilowatt continuous wave telegraph and telephone transmitter. In the following month a set of similar design, but two and a half times as powerful, was erected, and marks the inauguration of the first wireless telephone news service in the world, clear and distinct speech being received on ships over a thousand miles distant, using only the

ordinary type of ship's receiver. The source of power was a 200-cycle, 500-volt; 15-kilowatt alternator feeding the primary of a 20,000-volt transformer. Large valve rectifiers with accessory condensers maintained a fairly smooth source of direct voltage, for the transmitting valves of which six were used in parallel. With the circuit used the modulation is brought about by shunting the aerial tuning inductance by a varying resistance (the anode circuit of the so-called "absorption" valve), which resistance is caused to vary (by means of amplified grid control) in accordance with the speech frequency as interpreted electrically by the microphone.

During the year some important communications have been made on the subject of Duplex Wireless Telephony on Aircraft as investigated at the R.A.F. Wireless Experimental Establishment. The primitive system of having a change-over switch to make the change from sending to receiving circuits reduces the utility of the simple radiotelephonic set, and a scheme similar to that of ordinary Line Telephony is much to be desired. The solution of the problem practically resolves itself into that of protecting the receiver from the transmitted radiation of the same set. The various valve methods in use for this purpose at ground stations are not feasible for aircraft work and schemes of an entirely different nature have been tested. The quiescent aerial arrangement first proposed by the General Electric Company in America and independently by Professor Whiddington in England has been given a thorough trial. In this scheme the transmitting microphone circuit is inductively coupled to the anode circuit of the oscillating valve, so that oscillations are maintained in the transmitter only while speaking. The unsatisfactory nature of the signals obtained is supposed to be due to the lag between the anode voltage variation and the amplitude variation of the oscillatory current. A much more satisfactory scheme was found to be available in the use of different wavelengths for transmission and reception. A single aerial circuit was used with suitable accessory absorbing circuits, and it was found possible to work satisfactorily with a frequency difference as low as 10 per cent. of the actual frequencies used.

As has been stated above, considerable progress has also been made in the quantitative elucidation of triodes and their circuits. The progress made in this direction by the Wireless Departments of the Navy has been summarised in a communication by B. S. Gossling dealing with the design of receiving valves from various theoretical and experimental considerations. Such work was made possible by the mathematical theory of the cylindrical triode developed by Sir J. J. Thomson, and the experimental data on the emission of the short-tungsten filaments available from the researches of G. Stead. Methods of testing and comparing triodes in terms of satisfactory electrical quantities have been developed by W. F. Jordan, F. E. Smith, and the late H. C. Napier, and Professor W. H. Eccles, while the last-named in numerous papers and lectures has expounded a simple and adequate theory of triode action, and also drawn the attention of workers in other branches of pure and applied physics to the invaluable laboratory instrument originated and developed by workers in Radio-telegraphy.

Of special interest are the two automatic calling-up devices announced during the year. The first is due to the Marconi Company,

and has a range of about 80 miles. A series of dots of a frequency 3-per-second on the standard 600-metre ship's wave are transmitted using a relay signalling key controlled by an oscillating flywheel swinging at the desired rate. The receiver is a three-valve amplifier used in conjunction with an oscillating relay similar to the one used in the transmitter. The small balance wheel of the receiving relay is set in motion by the amplified received currents, the amplitude increasing until a contact is closed and the call-bell operated. The second type, due to B. Binyon, is designed to operate with Morse signal calls of three or four letters, and makes use of a Turner valve relay and a selector mechanism, due to Shepherd. The apparatus can be set to respond to the call of S.O.S. and the receiving ship's call.

The problem of high-speed transmission is a vital one in present-day commercial Radiotelegraphy, and in this connection some experiments in progress at the Army Signals Experimental Establishment are of interest. In communication between Woolwich and Weymouth it has been found practicable to handle wireless traffic up to a speed of 113 words per minute, using punched tape transmission and Wheatstone inkler reception. Much difficulty is not anticipated from the electrical side in the attempt to attain much higher speeds, but the difficulties of mechanical design are expected to prove more formidable. Obviously a signal strong enough to activate an inkler could also be employed to operate a printer receiver of the Creed or other well-known types, and so translate the wireless message direct to land lines. One disadvantage, however, of such high-speed working with valve generators is that the purity of the wave is partly destroyed and the selectivity diminished because of the increments and decrements at the beginnings and ends of each signal.

The old problems of the cause and elimination of atmospherics still occupy the attention of many workers. With regard to the origin of these undesirable signals some experiments in another field of scientific investigation have emphasised the magnitude of the electromagnetic effects of thunderstorms. The recent researches of C. T. R. Wilson on the sign and magnitude of lightning flashes have shown that a current of many thousands of amperes is involved in a lightning stroke. Such an antenna current may well be the origin of an electromagnetic disturbance which travels more than once round the earth giving rise to multiple effects in a receiving antenna. The effect of the upper atmosphere in the transmission of both artificial and atmospheric signals still presents a fascinating field of research and data with respect to the measurement of signal strength and the determination of the variations of electromagnetic bearing of a given distant transmitting station are being patiently collected and correlated. With the more refined methods now available for the determination of these two quantities much progress on these lines may be anticipated in the near future.

During the year the findings of the Imperial Wireless Telegraphy Committee, appointed in November, 1919, by the Secretary of State for the Colonies, "to prepare a complete scheme of Imperial Communication in the light of Modern Science" have been published. Judging from various Post Office records submitted, the Committee formed the opinion that no satisfactory commercial wireless service is in operation

working over a distance of 2,000 miles, and recommend that the links in the Imperial chain be not greater than this distance. With the exception of the Poulsen arcs at present being constructed for the Cairo-Oxford service the Committee recommend the use of thermionic valves generators, the constructional work to be carried out by the Engineering Department of the General Post Office.

PROGRESS IN RADIO COMMUNICATION IN THE UNITED STATES, 1920

BY ALFRED N. GOLDSMITH, PH.D.,

Editor of the "Proceedings of The Institute of Radio Engineers."

FOR the convenience of the reader, the subject matter of the following résumé has been classified under a number of headings.

Radiotelegraphic and Telephonic Transmitters.

The only new high-power transmitting equipments installed in the United States during 1920 have been of the Alexanderson alternator type. A considerable number of the 200 kilowatt units have been built, and have been or are being installed at Marion, Massachusetts; New Brunswick, New Jersey; Tuckerton, New Jersey; Kahuku, Hawaii; and Bolinas, California. The first three stations named handle traffic between the United States and Norway and Germany, England, and France respectively. The last two stations handle the traffic of the circuit between Japan and the United States.

Each of the alternator equipments in the stations referred to consists of at least two of the 200 kilowatt units, together with their associated radio frequency transformers, magnetic amplifier control for telegraphy, high-speed telegraphy, and telephony, speed control and tuning gear, and a large multiple tuned antenna. It is of interest to

note that these complete 200 kilowatt alternator apparatus assemblies are being built at the works of the General Electric Company for the Radio Corporation of America at the rate of two per month.

Work has been begun of the great New York Radio Central of the Radio Corporation of America, situated near the centre of Long Island. A tract of ten square miles has been purchased, on which there will be erected twelve long antennas. Each of these will be supported by six four-hundred-foot towers, and will be a mile and a half long. Multiple tuning of the antennas will be used, together with combined direct and capacitive grounds. The arrangements of the station will be such that the antennas and alternators can be transferred and combined at will. Thus, two or three, or more, of the antennas may be connected together as one large antenna, and the resulting combination fed from two of the alternators running in parallel. Such an arrangement would give a greatly increased radiation, and would be suitable for either extra long distance communication, high speed telegraphic communication, or radio telephony.

Commercial radio telephony in conjunction with the wire network of the country has been opened up by the American Telephone and Telegraph Company and the Western Electric Company. A radio link between the Californian coast and the Catiline Islands, a distance of 30 miles, has been established. Short waves are used, and duplex service is furnished. This radiophone service is at the disposal of every telephone subscriber in the United States. It has proved very popular, and is now used by the Catiline Islanders and others in a thoroughly matter-of-fact way.

Radiotelephony between ship and shore has also been established between the Foxhurst station of the Western Electric Company and a coastwise steamer. During a recent test, a number of persons on board this steamer in the Atlantic Ocean talked with individuals on the Catiline Islands through an interesting circuit consisting of radiophone over a hundred miles of the Atlantic Ocean, wire telephony across three thousand miles of continent, and radiophone across thirty miles of the Pacific Ocean. This is the first time in history that the voice of man has been carried across a continent and stretches of two adjacent oceans.

Arc transmitters in the 5 kilowatt, 2 kilowatt, and 0.5 kilowatt sizes have been developed by the Wireless Improvement Company. Of these, the most interesting is the last named. This is a semi-portable automatically controlled arc which operates directly on the ship 110-volt direct current supply without any motor generator. The arc is regulated automatically by solenoid control, drawing 500 watts from the ship's mains. At 600 meters, 3 amperes are put into the average ship's antenna; at 300 meters a current of 2 amperes is obtained.

A number of radiophone outfits in various sizes have been produced by the De Forest Radio Telephone and Telegraph Company. Unusual ranges of transmission have been found possible under especially favourable conditions as regards static and interference. One of the types of radiophone developed is a portable 5 or 10 mile outfit operated on storage battery and without motor generator. The plate voltage is obtained from a buzzer interrupter and appropriate transformer. Such outfits can be built to weight under 60 pounds.

A special spark set capable of emitting waves of unusually low decrement has been constructed by the Wireless Improvement Company. It consists of the ordinary 500 cycle quenched spark exciting circuit, closely coupled to an intermediate low-resistance circuit containing inductance and capacity, and of low resistance. Loosely coupled to this intermediate circuit is the ordinary antenna circuit which withdraws energy slowly from the intermediate circuit, the rate depending, of course, on the coupling between the two. Practically a single sharply defined wave is emitted, with varying amplitude corresponding to a 500 cycle note but with much diminished energy decrement. Thus, on a wooden ship having an antenna of such characteristics that the lowest decrement obtainable by associating the quenched gap circuit directly with the antenna was 0.2, by adding the intermediate circuit and properly adjusting the coupling, the measured decrement of the emitted wave was 0.02.

A low power duplex radiophone set produced by the Western Electric Company is based on the use of an artificial antenna having the same electrical characteristics as the actual antenna. The receiving set is so connected that the effects of the transmitting currents in the actual and artificial antennas neutralise, whereas incoming signal currents from the actual antenna produce an effect in the receiver circuits. Careful shielding of the various parts of this set is shown in the published illustrations.

The radio telephone has been used during 1920 for the first time in reporting the International Yacht Races. Airplanes and blimps, flying over the course and equipped with radiophone and radiotelegraph apparatus, have sent direct news of the progress of the races to the Editorial offices of the *Evening Post* in New York. The installation, which included amplifiers and loud speakers capable of giving signals readable at distances of 500 to 1,000 feet from the receiver, was carried out by the Radio Corporation of America. A land station of the corporation was also remotely controlled from the Editorial offices during these tests, and two independent receivers were in operation. Thus, probably for the first time, quadruplex radio communication was carried on. It is interesting to note that these yacht races were reported by radio by Marconi himself just twenty years ago.

Receivers.

The development of the special forms of receivers suitable for long distance working has been rapid during the year. A number of installations of modern type have been made for handling the traffic from Europe and the Orient, namely: for Norway and Germany at Chatham, Massachusetts; for England and France at Belmar, and Lakewood, New Jersey; for Hawaii at Marshalls, California; and for Japan at Koko Head, Hawaii. In addition, a long distance experimental receiving station has been established, also by the Radio Corporation of America, at Eastport, Long Island. In all of these stations, circuits of the utmost selectivity have been used, together with new forms of continuous wave detecting systems, the details of which are not at this time available.

Each of these stations is arranged for high speed recording. Among the various systems in use or under development at these stations are the phonograph or acoustic recorder and the Hoxie or photo-

graphic (visual) recorder. This latter device is a tuned reed vibration galvanometer of special design, and has been found to be capable of recording messages up to several hundred words per minute.

The unicontrol receiver developed by the Wireless Improvement Company has been improved in detail for use in connection with regenerative or heterodyning circuits, and its wavelength range has been extended to from 200 to 5,000 metres. When equipped with motor drive, it enables picking up any land or ship station within its wavelength range more or less automatically.

Vacuum Tubes.

The development of high and low vacuum receiving tubes by the General Electric Company during the year has been rapid, and several new forms of tubes have become available.

In addition to the development of higher power oxide-coated filament tubes, the Western Electric Company has produced an unusually small form of detector tube. Its filament requires but 1 volt. and 0.18 ampere at a plate voltage of 10 volts. Yet the tube has practically as great detecting capabilities as the larger well-known forms.

A series of transmitting tubes operating at voltages of from 500 to 1,800 volts. and with inputs of from 10 to 1,000 watts have been produced by the De Forest Telephone and Telegraph Company.

As the results of measurements and theoretical investigations by Dr. J. Miller and Mr. J. Weinberger (independently) it was found that the input, or grid circuit, impedance or ordinary three-electrode tubes at radio frequencies was not infinite, as had generally been previously supposed, but finite and dependent on the character and constants of the plate or output circuit. This effect is apparently due to the capacity couplings within the tube, and seriously influences the possibilities of securing high amplification with small input energy.

Static Elimination.

Mr. R. A. Weagant of the Radio Corporation has further developed his three-loop system of static reduction, and this system has been effectively used both experimentally and commercially at Lakewood, New Jersey on the English circuit.

Commander A. Hoyt Taylor, of the Navy, has reported tests of ground wires (subterranean and submarine) for static reduction, and it is stated that he has not only obtained marked results in this direction but has also been able, because of the directional selectivity of such receiving systems, to secure effective duplex operation with the transmitting station in the immediate neighbourhood of the receiving station.

As an interesting sidelight on what may be expected *if static were to be practically entirely eliminated*, there may be mentioned the recent remarkable achievement of a certain amateur who succeeded in sending intelligible radiophone messages from New Jersey to Aberdeenshire, Scotland, with a 100-watt radiophone transmitter!

Duplex Communication.

In the transoceanic service, it is necessary to utilise the capacity of the transmitting stations to the utmost. This involves duplex communication. The problem of receiving a weak signal from Europe

through atmospheric disturbances, with a transmitting station of several hundred kilowatts power radiating at a wavelength only a few per cent. different from the distant signal is a difficult one, particularly when the transmitting station is 10 or 20 miles from the receiving station. This problem has been solved by the use of a number of duplex balancing arrangements which have been developed and installed at its receiving stations during 1920 by the Radio Corporation of America.

Still other duplex methods, particularly adaptable to radio telephony, have been developed and described by Mr. Alexanderson. These involve the use of two antennas, and a Wheatstone Bridge for radio frequencies with the transmitter and receiver, in effect, in conjugate branches.

As previously stated, the highly directional receiving characteristics of subterranean and submarine long wire antennas have enabled Commander A. Hoyt Taylor and Lieutenant A. Crossley to work out an effective duplex system, wherein the transmitting set is remotely controlled from the comparatively nearby receiving station.

Radio Navigational Aids.

The use of cables carrying an audio frequency current under navigable channels as an aid to navigation has found increasing vogue in the United States during 1920. Although the method is not strictly one involving radio communication, the receiving apparatus is in some respects similar to that of a loop receiver for radio work. The ship carries a loop mounted so that it can be tilted about vertical and horizontal axes, this being connected to a multi-step vacuum tube amplifier. The magnetic field of the alternating current in the submerged cable cuts the loop on the ship, inducing currents which after suitable amplification are listened to in the pilot house. It is not difficult to decide whether the ship is off her course by swinging the loop and also by noting whether the signals are becoming fainter.

Mr. Robert H. Marriott carried out a number of experiments along these lines in Puget Sound. Successful results were obtained. A destroyer was also piloted straight through New York harbour to her berth by a navigating officer who did not employ any of the usual aids to navigation, relying altogether on the inductive signalling method above mentioned. The marking of a tortuous channel by these methods will be increasingly common practice. In one interesting modification of this method, speech currents are used in the submerged cable, thus making it possible at certain dangerous points in the channel to issue definite warnings, or instructions, from short sections of cable.

The errors to be expected in radio direction finding have been experimentally investigated and the results made public by Major C. Kinsley. The errors referred to are those which correspond to actual changes in the direction of the incoming wave rather than those due to remediable apparatus faults.

Miscellaneous Equipment.

A new form of synchronous commutator converter of alternating to direct current has been produced under Mr. Sewall Cabot's patents by the American Radio and Research Corporation. The forms of the

device produced so far are intended for the generation of high voltage direct current, and in particular, for feeding the plate circuits of transmitting vacuum tubes.

A considerable number of improved forms of audio frequency amplifiers, radio frequency amplifiers, tube detectors, and combinations of the foregoing have been recently produced by a number of the leading manufacturers. These are coming into increasingly common use in the commercial and amateur stations.

Radio Legislation.

The Preliminary International Communications Conference has gone into session at Washington recently. Representatives of England, France, Italy, Japan, and the United States constitute the membership. The Conference is charged with the task of drawing up recommendations to the International Communications Conference to be held in Washington in the Spring of 1921. Since the whole problem of long and short distance radio communication all over the world come within the scope of the activities of the Conference, their recommendations will be awaited with much interest by the radio field.

SOME OUTSTANDING PROBLEMS OF RADIO RECEPTION, WITH PARTICULAR REFERENCE TO INTERFERENCE

BY PHILIP R. COURSEY, B.Sc., A.M.I.E.E.

IN the reception of wireless messages many difficulties are experienced, for some of which solutions or partial solutions have been found, while for others no such success has yet been achieved. Of these difficulties the most serious has been that of interference, both tuned and untuned—the former from other radio stations and the latter from natural electrical disturbances or atmospherics.

The reduction of interference from other wireless stations can to some extent be effected by increasing the difference of wavelength between the interfering stations. This, however, is not a very practical solution. It entails a reduction in the number of stations that it is possible to operate in a given area. Owing to the great range of modern high-power stations working on long wavelengths, the “area” just referred to becomes the whole surface of the earth. A limit is thus placed upon the number of high-power transocean stations that can be erected on the earth if they are not to cause interference with each other.

For instance, suppose that when working between, say, 10,000 and 20,000 metres wavelength, which constitutes the present field for high-power work, it becomes necessary to stipulate that there shall be at least 1,500 metres between the wavelengths of any two stations. The maximum possible number of high-power stations in the world must then be limited to seven—a number which has already been considerably exceeded. One way out of the difficulty is evidently to increase the available range of wavelengths, but even this is limited in practical working, as the use of very long wavelengths entails the provision of excessively large and costly aerial systems.

An increase in the number of stations that can be operated between given wavelength limits can only be effected by increasing the selectivity of the receiving apparatus to render it immune from the effects of radiation on other wavelengths. Once again, however, there are practical limits, the most important of which arises through the wavelength changes consequent upon the mere act of signalling. When a uniform continuous wave is modulated by speech currents as in radiotelephonic transmission, the resultant (modulated) wave that is radiated has a variable wavelength, as is well known. The limits of the frequency variation are determined by the limits of the frequency of the impressed modulating currents. Likewise when modulating the waves into telegraphic signals there must be a similar frequency variation dependent upon the frequency of the current changes brought about by the telegraphic key. Each station then must radiate not one single wavelength, but all waves comprised between two limits closely adjacent to the normal unmodulated wavelength, commonly called the wavelength of the station.

As a consequence of this it is easy to see that the selectivity of the receiver cannot be increased indefinitely. It must remain sensitive

to the whole band of wavelengths that is emitted by the transmitter. Once again, then, there is a limit to the workable wavelength difference that it is possible to have between stations. Taking all things into consideration it is doubtful if more than eight to ten times the present number of high-power stations in the world could be worked satisfactorily.

Fortunately there remains another factor which has an important bearing upon this question. Directive reception is here referred to. If by appropriate design of the receiving aerial system it is possible to render the apparatus unresponsive to all signals save those originating in a given direction, a much greater number of stations can be operated in comparatively close proximity. Such directive reception can now be effected with at least partial success. By this it is meant that the apparatus can be made to be most sensitive to signals coming from one or two given directions, but that it still remains at least partially sensitive in others. By the use of directive receiving apparatus it is thus possible to augment the volume of traffic that can be handled by the high-power radio stations of the world.

The provision of an adequate duplex system between a pair of radio stations enables a further increase to be made in the work handled by those stations. This aspect of the subject is closely related to that of directional reception and transmission, and involves the provision of receiving apparatus that shall be immune to the tuned interference of the nearby transmitter, but responsive to the signal from the more distant station. One form taken by such a receiver includes the use of a system of balancing aeri—als—that is, one in which the receiving station is equipped with two aerial systems, one concerned mainly with picking up the long-distance signal, but being at the same time also responsive to the nearby impulses from the local transmitter, and the second designed to pick up the signal from the nearby transmitter only. A proper combination of these may be effected so that the strong local signals are cancelled out, leaving only those from a distance. This method was installed at the Marconi transatlantic stations some years ago.

With the more extensive development of the closed loop or frame as a receiving aerial, consequent upon the use of sensitive amplifying equipment, another and very simple arrangement has become possible.

A closed loop aerial is most responsive to a signal wave when the plane of the loop is oriented in the direction of the station from which the signals are emanating. As the plane of the loop is turned away from this direction, the amount of energy absorbed from the passing wave becomes less, falling to a sharp minimum or even to zero when the loop plane is perpendicular to the line joining the

Fig. 1.

Arrangement of receiving loop aerial near the transmitting station. A=Local Transmitter; B=Distant Station.

two stations. Thus in order to ensure that a loop aerial used for reception from a distance shall be unaffected by a closer transmitting station it suffices to dispose it tangentially to a circle drawn with the local transmitter as centre, at such a point that its plane is in line with the distant station, Fig. 1. This method has also been used—notably in France—in regular transatlantic signalling.

Many other and more complicated arrangements—both in the form of special aerials, “barrage” receivers, etc., and of filtering apparatus to permit the passage of a given band of wavelengths only—have been developed and used under the stress of war conditions. Space will not permit of their full treatment here, but some further details may be found amongst the articles listed in the “Radio Literature” section included in this volume.

Apart altogether from the improvement of long-distance radio services by the reduction of interference from other stations, it is possible to effect an increase in their traffic capacity by augmenting the speed of transmission. In ordinary land line telegraphy it is now quite customary to employ high-speed sending apparatus in combination with a suitable recording receiver—which may take the form of a high-speed printer. The application of such high-speed apparatus to radio work is not, however, an easy task, and although some measure of success has already been achieved much more remains to be accomplished.

With modern transmitting apparatus of almost any type, there is little real difficulty in operating it at a fairly high rate of speed—say, of 100–250 words per minute—by an appropriate Wheatstone transmitter or similar form of control. The reception of these high-speed signals is the more difficult task. Good results have been secured by the use of dictaphone recorders for taking down the incoming signals on wax cylinders from which they can subsequently be transcribed by ear at a slower rate.

By the use of amplifying apparatus at the receiver, the incoming signals can be magnified sufficiently to operate some form of relay, thus enabling them to be recorded by any ordinary type of telegraph apparatus. Thus the possibility of the direct high-speed reception and printing of a radio message becomes evident, but the commercial application of this on an extensive scale yet awaits completion.

As a subsidiary to some such scheme of high-speed working as the above, the problems of automatically linking the wire and wireless telegraphs may properly be discussed. The direct control of the apparatus in a radio-transmitting station by telegraphic signals passed over an ordinary land-line telegraph presents no serious difficulty; the similar process at the receiving end of the wireless link is again the more difficult. One form of the solution is to be found in an adaptation of the automatic printing receiver to which reference has already been made. In one at least of these receivers when used for land-line working the received signals do not operate the printer mechanism directly, but control the working of a punching machine, so that a paper strip passing through the machine is punched with a series of holes corresponding with the Morse characters of the incoming message. Such a tape may, instead of operating the printer, be used to control another automatic transmitter for repeating the same message along a further stage of telegraph line. The successful operation of a punch-

ing machine of this type at the receiving end of a radio system would thus provide a means of passing the incoming messages straight on to the land-lines for further transmission from the radio "trunk-terminal" station directly to the town wherein the addressee of the message is resident. A considerable saving both in time and in operating costs might thus be affected with, at the same time, an increase in the utility of the radio system.

Possibly the more useful application of relaying apparatus to link the wireless with the land-lines is to be found in the case of radio-telephony. The enormous advantages of such linking are here obvious. The proper sphere of high-power radiotelephone stations then corresponds with that of the long-trunk telephone lines with the advantages of being able to traverse oceans as well as continents and with greater ranges than in the case of physical trunk lines. The communicating of the land-telephone lines with radio stations on ships and in the air is also included in any such scheme of linking.

It may also be interesting to note here that during the current year an installation has been opened at Catalina Island, off the Californian coast, to link up the island with the telephone system on the mainland. Any island telephone user can thus speak directly with any mainland telephone subscriber *via* the wireless system, and the automatic relaying apparatus. An apparatus for this purpose has also been devised by Marconi's Wireless Telegraph Co., in this country. In connection with this linking of wire and wireless networks some simplification of the difficulties of receiving and relaying may be lessened by the employment of "wired-wireless" transmission over the land-lines. The main principles of wired wireless work—that is the transmission of radio-frequency signalling currents along ordinary telephone or telegraph wires—have been known for a number of years, but their practical application in commercial apparatus has awaited the development of reliable thermionic valve apparatus. In Germany the method has now been applied to a number of trunk lines and is giving very satisfactory service, while some brief accounts have also been published of some American developments on similar lines.

As regards its application to the problem of linking wire and wireless transmission, it may prove advantageous at the radio-receiving station merely to amplify up the incoming signal-modulated oscillations by appropriate receiving amplifiers, and then to couple directly to the land-lines for transmission along them to the distant land station. At that point the ordinary repeating apparatus that has already been developed for relaying a subscriber's telephone circuit to a wired-wireless circuit would be employed. Thus the apparatus at the radio station might be simplified. The wired-wireless transmission need not necessarily be carried on at the same frequency as that of the waves received at the radio station, as a frequency changing unit of a heterodyne nature may be incorporated with the amplifiers.

In any and all of these arrangements here referred to precautions must evidently be taken against tuned interference from other radio stations. This aspect of the subject has already been discussed, but there remains another and more troublesome type of interference which at present constitutes what is perhaps the most serious obstacle in the development of long-distance radio work—viz., untuned interference from natural electrical disturbances or atmospherics.

These disturbances, or "strays," are also often referred to as "X's," and frequently also as "static"—the last particularly in America. The use of the term "X" dates back to the days of the early coherer receiver, when all messages were recorded on the tape of a Morse inker operated from the coherer and its attendant relay. On these tapes irregular and unintelligible marks were frequently found which from their unknown source and origin were termed X's. The development of the modern sensitive receiving apparatus has enabled it to be recognised that these X's are not all of the same nature, but it has at the same time rendered more difficult of solution the problem of the elimination of their effects. Some of them evidently originate in local thunderstorms and lightning discharges, but others have no such obvious source, and from their widely distributed nature they are supposed to be caused by electrical disturbances of the earth's atmosphere as a whole—possibly originating in some disturbance entirely external to the earth itself.

It has been found that the different types of atmospheric possess differing electrical characteristics, so that the elimination of the effects of each kind constitutes a different type of problem requiring a different solution. At the present time three main types are usually recognised, although the infinitely fine gradation of type renders classification difficult. They are generally known as: Grinders, clicks, and hisses. Of these, the first type is probably the most prevalent, and includes all the various miscellaneous sounds commonly associated with atmospherics other than those specifically described by the second and third designations. As a general rule the "click" variety of atmospheric arises through isolated lightning and similar electrical discharges in the atmosphere, while the "hisses" are due to static discharges from or to the aerial itself, such as may be caused by induction from highly charged clouds, by charged rain falling on the wires, or by snow squalls. It frequently happens, however, that the atmospherics heard partake of the characteristics of all three types, and this renders their classification not at all easy. This is often particularly the case with atmospherics arising from a nearby thunderstorm, the sounds in the receivers due to each discharge commencing with the hissing and sizzling of the preliminary bush discharges, continuing as a loud rattle as the breakdown extends through the air and often finishing with an extremely loud "click" when the actual "flash" occurs. There are also other forms characteristic of particular localities—especially the tropics—which seem to require special groups for themselves, and which offer special problems when the elimination of their effects is attempted. The third of the three main types mentioned above is as a general rule perhaps the least difficult to render harmless as far as the receiving apparatus is concerned. Since this class of sound *generally* arises through electrostatic induction it suffices to shield the aerial from such induction by an appropriate electrostatic shield or cage. For this purpose the aerial wires are disposed in the interior of a metallic network which is maintained at earth potential. If this shield is constructed of a continuous network of copper wires, wire netting or similar material, it is generally found that too much energy is abstracted from the signal waves, so that the intensity of reception is considerably reduced. An alternative is to build the network either of resistance wire, or in a number of separate sections electrically united through resistances, which serve to prevent the establishment of any considerable oscillating currents in

the network while maintaining the parts all at approximately earth potential as far as electrostatic induction effects are concerned.

As regards the other forms, the difficulty of the separation of the signal from the atmospheric disturbances lies mainly in the close electrical similarity between the currents set up in the aerial system by the two causes. In the great majority of cases the action of an atmospheric impulse on the aerial system partakes largely of the nature of what may be termed an electrical blow or impact. It is well known that if a sharp blow be imparted to any material body capable of vibrating—such as a spring, a bell, or a pendulum—it will be set into oscillation with its own natural vibration frequency almost independently of the characteristics of the impact. The vibrations thus set up will decrease in amplitude in accordance with the natural decrement of the vibrating system, unless the case is complicated by the frequent recurrence of the impulsing blow, such as would usually take place in the electrical case. The electrical oscillations set up in the receiving aerial will thus possess practically the natural oscillation frequency to which the aerial circuit is tuned, and will generally have a decrement proper to that circuit. Since, however, the aerial circuit is customarily tuned up to the wavelength of the signals to be received, it is evident that both signal and atmospheric currents will possess practically the same characteristics, and their separation by any ordinary method of tuning is rendered very difficult.

Perhaps the simplest solution—or at least partial solution—of the trouble is to be found by omitting this tuning of the aerial circuit to the signals, so that the natural oscillations set up by the atmospherics will thus be given a frequency different from that of the signals it is desired to receive. The incoming signals if their decrement is very small—or preferably if they are sent with sustained waves (C.W.)—will be able to force an oscillation in the aerial circuit of their own frequency, and thus affect the tuned secondary circuit coupled to the aerial. This coupling must be a very weak one, or the atmospherics will impulse the secondary directly. At least a partial separation of signal from the atmospherics is thus possible.

Many variations of this idea have been suggested—using either a single aerial with two or more separate branches to earth, or two or more aerial systems, one of which can be tuned to the signal and the other detuned. But a very indifferent separation can as a rule be obtained by any of these arrangements as they nearly all overlook the fact that if the two branches of the aerial system, or the two separate aerals, are tuned to different frequencies, the currents set up in them by the atmospheric impulses will have the frequencies of those branches, so that being different they can never accurately neutralise one another when the two aerial circuits are combined together in opposition to one another. The signal currents *should* remain since they are set up in one aerial circuit (the one tuned to their wavelength) only, but usually a very considerable proportion of the original disturbances remains too.

An improved arrangement has been devised, designed with a view to overcoming this difficulty of non-equality of the frequency and waveform of the currents in the two aerial circuits. The principle of this method is that the two circuits are not coupled directly to the receiver, but through a form of frequency changer—which for

convenience may take the form of a heterodyning valve. This frequency changer is so arranged that currents having the frequency of one of the aerial circuits will be changed to equality with that of the other, to enable a more precise neutralisation to be secured. When a valve is used to effect this transformation its oscillation frequency must be adjusted so that one of the beat-frequencies between one aerial circuit and the local oscillation is the arithmetic mean of the frequencies to which the two aerial circuits are tuned.

Attempts to solve the problem of receiving radio signals through atmospherics have also been made along other lines with at least partial success. Some only of these methods can be briefly indicated here.

As an alternative to trying to *eliminate* the effects of the atmospherics, it is possible to arrange apparatus that will limit the response of the receiver to a certain definite maximum, and thus prevent the signal being entirely drowned out by an atmospheric of several times greater intensity. The valve limiter of G. M. Wright, and the balanced crystal, balanced valve and similar types of receivers may be mentioned in this connection as examples of what has already been

Fig. 2.

General scheme of Turner's "Kallirotron" Limiter.

accomplished. A new arrangement of valve limiter has recently been devised by L. B. Turner, and termed by him a "Kalliroton Limiter," which may prove useful for work along these lines. The general arrangement of this limiter is shown in Fig. 2. Two valves, V_1 , V_2 , are used, arranged in cascade after the manner of a two-stage amplifier for very low frequency, or D.C., amplification. The output circuit of V_2 is, however, led back again to the input of V_1 , so that the input

Fig. 3.

Typical Output curve for the "Kallirotron" Limiter.
(This particular curve corresponds to a "weak-signal magnification of $\mu = 100$.)

terminals of the two-valve unit become those marked A, while the output is joined on at B. The great advantage of this limiter over those of the dimmed filament type, in which the intensity of response is limited by reducing the saturation current of the valve, is that if the impressed impulse exceeds the critical maximum, not only does the output not increase, but it actually decreases, Fig. 3. An extra strong atmospheric should thus produce less effect on the receiver than a signal of lesser intensity.

Reference has already been made to the advantageous effect of receiving aerial systems having directional properties upon the traffic capabilities of high-power stations. A directional aerial system enables the tuned interference from other stations to be lessened, and as a consequence the stations to be worked with a smaller wavelength difference between them. Such aerial systems are also advantageous from the point of view of atmospheric disturbances. Since they are most responsive to signals arriving from certain directions, they will also receive the effects of atmospherics with the greatest intensity from those same directions. This, therefore, means that such aerials will receive less interference from atmospheric disturbances propagated from places not lying in the plane of maximum reception. The total disturbance of the station by atmospherics is thus

Fig. 4.

Receiver using a loop aerial both as a closed loop and as an open antenna, to lessen the effect of atmospherics.

reduced to some extent. These remarks apply to all forms of directional receivers, but with greater force to those having a polar reception curve which departs most from the circular form. The polar curve may be further distorted by making the aerial system have a maximum reception in one direction only instead of in two, as is most usual. One method by which this may be effected is shown in Fig. 4, which illustrates a loop aerial A used both as a closed and as an open circuit receiver. The energy of the currents set up in the loop A is transferred to the detector circuit F, through the closed circuit B. The

Some Outstanding Problems of Radio Reception

loop as a whole as an elevated aerial having capacity tuned up by the coil D, and the energy of the currents in the coil is also transferred to the detector circuit F. This is effected through the circuit C which contains a means for adjusting the phase of the currents.

The operation of a circuit of this type may be explained not only to its greater directive properties, but also to its ratio of signal strength to atmospheric strength in the ratio of aerials. Thus suppose in the case of the closed loop strength may be represented by (x_1S) and the atmospheric strength is (x_2S) and the atmospheric strength (y_1A) , the receives $(x_1S + y_1A) - k(x_2S + y_2A)$, and by adjusting the couplings between the circuits we can make y_1 the resultant effect upon the detector may be expressed as kx_2x_1 , as the ratio x/y is different in the two cases.

Thus, apart altogether from any directional effect on themselves, it is possible to obtain at least a partial solution of the problem of atmospheric elimination by combining together having different electrical characteristics. In this connection results have been obtained by a combination of a loop aerial—that is one consisting of one or more loops buried in the earth or immersed in the sea or in a river. experiments of this type have been described by A. Hoy it is claimed that quite good results are obtainable. forms of anti-atmospheric devices described by R. A. of the loops is to form two aerial systems having different signal strength to atmospheric strengths, so that when combined together the resultant currents contain a preponderant signal. A good summary of this aspect of the subject in a recent paper by G. W. Pickard (*Proceedings of the Radio Engineers*, October, 1920).

In connection with this problem, some reference has been made to the difficulties of separating the signals from the noise entirely by means of the tuning of the circuits. The selection means will, however, be the greater the smaller is made the resistance of the circuit. The use of the three-electrode tube has provided radio workers with a means of reducing the effective resistance of any given circuit, or even of making it zero or to a negative value in certain circumstances.

Whenever a triode tube is provided with reaction coils and grid circuits in such a manner as to tend to increase the effective resistance of the circuits to currents of the particular frequency for which the circuits are tuned. The effect of such reaction is expressed as the addition of so much negative resistance to the circuit, since the actual ohmic resistance of the circuit must necessarily remain the same. Hence if such devices are incorporated into the radio receiving circuits it will be possible

loop as a whole as an elevated aerial having capacity to earth is tuned up by the coil D, and the energy of the currents flowing in this coil is also transferred to the detector circuit F. This transference is effected through the circuit C which contains a means of adjusting the phase of the currents.

The operation of a circuit of this type may be explained as due not only to its greater directive properties, but also to the difference in the ratio of signal strength to atmospheric strength in the two types of aerials. Thus suppose in the case of the closed loop the signal strength may be represented by (x_1, S) and the atmospheric strength (y_1, A) ; whereas when the loop is used as an elevated aerial the signal strength is (x_2, S) and the atmospheric strength (y_2, A) , then the detector receives $(x_1, S + y_1, A) - k(x_2, S + y_2, A)$, and by adjusting the variable couplings between the circuits we can make $y_1 = ky_2$ so that the resultant effect upon the detector may be expressed as $(x_1 - kx_2) S$, showing that the effect of the atmospheric has been cancelled out, since kx_2/x_1 , as the ratio x/y is different in the two cases.

Thus, apart altogether from any directional effect of the aerials themselves, it is possible to obtain at least a partial solution of the problem of atmospheric elimination by combining together two aerials having different electrical characteristics. In this connection, good results have been obtained by a combination of a loop aerial with a buried aerial—that is one consisting of one or more insulated wires buried in the earth or immersed in the sea or in a river. A number of experiments of this type have been described by A. Hoyt Taylor* and it is claimed that quite good results are obtainable. The various forms of anti-atmospheric devices described by R. A. Weagant may be placed in this class, since the effect of the particular combinations of the loops is to form two aerial systems having different ratios of signal strength to atmospheric strengths, so that when they are combined together the resultant currents contain a preponderance of the signal. A good summary of this aspect of the subject may be found in a recent paper by G. W. Pickard (*Proceedings of the Institute of Radio Engineers*, October, 1920).

In connection with this problem, some reference has already been made to the difficulties of separating the signals from the atmospherics entirely by means of the tuning of the circuits. The selection by this means will, however, be the greater the smaller is made the effective resistance of the circuit. The use of the three-electrode thermionic tube has provided radio workers with a means of reducing indefinitely the effective resistance of any given circuit, or even of reducing it to zero or to a negative value in certain circumstances.

Whenever a triode tube is provided with reaction between the plate and grid circuits in such a manner as to tend to set up oscillations, the effect of such reaction is equivalent to a reduction of the effective resistance of the circuits to currents of the particular frequency for which the circuits are tuned. The effect of such reaction may, therefore, be expressed as the addition of so much *negative* resistance to the circuit, since the actual ohmic resistance of the wires, etc., must necessarily remain the same. Hence if such devices are incorporated into the radio receiving circuits it will be possible to bring

* *Proceedings of the Institute of Radio Engineers*, August and December, 1919 (*Radio Review*, Abstracts Nos. 149 and 313), January and April, 1920.

about a reduction of their effective resistance to currents of a particular frequency, whereas to other frequencies no such reduction is obtained. A circuit offering a resistance of many thousands of ohms to currents of most frequencies, can in this way be made to show an effective resistance of but a few ohms to sustained wave signals of the correct frequency. Such arrangements are evidently of use in reducing the interference in the receiver due either to other tuned wireless stations or to atmospheric disturbances.

Some further selection of the signal from interfering currents may be effected by the addition of filtering circuits to the receiver, such circuits being designed to allow the passage through them of currents of the desired frequency only, and suppressing all others. The early Marconi X-Stopper belonged to this class, while, as more recent examples, may be mentioned the circuits patented by the Western Electric Co. (U.S.A.). These are designed to permit the passage through them of a narrow band of frequencies. Each filter consists of a series of units consisting essentially of a resistance in series with a condenser. If the output circuit is joined across the terminals of the condenser, the p.d. impressed upon it will fall if the frequency increases, whereas if it is connected across the resistance the reverse action will take place. Hence by connecting two such units in series it is possible to arrange matters so that the potential impressed upon the output circuit is reduced for any change in the frequency of the impressed currents whether increase or decrease from the critical value.

A filtering circuit that has been developed in France operates upon a somewhat different principle. It consists in the main of a series of closed loop circuits containing inductance and capacity, and so disposed that a stationary wave can be established along the series by an impressed e.m.f. of the correct frequency. The presence of this stationary wave can be made evident by its effect upon a suitably arranged amplifying and detecting apparatus coupled to the filter circuits. Currents or impulses of any other frequency or wave-form will not serve to establish such a stationary wave, with the result that their effect upon the detecting apparatus is reduced. This, again, is an arrangement adapted to protect the receiver from interference of both the "tuned" and "untuned" variety.

Apart from those referred to in the above outline, there are many other problems relating to the reception of radio messages for which but partial solutions have been obtained and which as a result await the result of further research work. Of these perhaps the most important from the point of view of the navigator—both on sea and in the air—is that of producing a receiving apparatus that shall give an indication not only of the direction of the transmitting station, but also its distance. Up to the present the only solution at all effective for this purpose, when only one receiving station is available, consists in a combination of wireless and acoustic transmission (through the air or under water), but a consideration of these schemes is outside the scope of this article, as are also those relating to the development of apparatus for recording wireless time and other signals that may be employed for astronomical purposes and for the determination of the longitude of places on the earth's surface.

THE RADIO COMPASS

BY STUART BALLANTINE.

I.—INTRODUCTION.

THE radio compass, direction finder, or goniometer, as it is variously denominated, is a device used to determine the direction of a source of radio signalling waves. If two radio compasses operate together, and are situated some distance apart, a plot of their individual observations gives two intersecting lines which fix the location of the transmitting station. Thus the usefulness of the device is considerably extended, enabling not only direction finding but "location finding" to be carried on.

The great variety of uses to which a device of this kind may be put will be evident. As a military and naval instrument in time of war, for example, furnishing detailed information about the radio activities of an enemy on land, on sea or in the air, the service it performs is unique; nor does its value end here, for in times of peace as an aid to the navigation of vessels, it has, perhaps, its most utilitarian applications. The great value of the radio compass is reflected by its phenomenal development and the steadily increasing numbers of stations in routine operation. In 1913 there was but a handful of such stations in actual use; in 1920 we find our coasts literally covered with them. This feverish development is due in some measure, of course, to war stimulus; but the real reason is the contemporaneous improvement in vacuum tube amplifiers. This is particularly true of the type of compass which I shall refer to in this article as the *rotating coil type*.

In present practice, we find two types of direction finder in use. The first type, the Bellini-Tosi instrument, is rather well known since many articles dealing with its description and operation have appeared. This ample literature provides little excuse for any mention of it here; furthermore, while some accounts of recent experimental developments are at hand, I refrain from reproducing this material for ethical reasons. The newer apparatus, concerning which little or nothing has been published, will be referred to as the *rotating coil type*. This device consists of a relatively small coil, usually a multi-turn coil, so arranged mechanically that it may be rotated about a vertical axis, and to which suitable tuning and detecting apparatus is connected. The coil is exposed to the radiation from the transmitter; the auxiliary apparatus below in the operating room is shielded from this radiation by a large Faraday cage.

Important advantages of this type of compass are its economy of space, its portability and the ease with which it may be installed in almost any place. These result from the small dimensions of the coil, which, however, also produce a receiving system of incredibly low efficiency; hence enormous amounts of amplification are necessary before a workable signal is obtained. The vacuum tube multi-stage amplifier is therefore essential to the successful employment of such small coils for direction finding purposes; and, until reliable amplifiers were produced the outlook for any extended practical application was cheerless indeed.

The inherent merits of this type of compass seem to have been recognised early by both America and France and the developments

made quite independently in these countries are largely responsible for its present efficiency and wide practical use. In America, most of this work has been performed under the auspices of the Navy Department, and, for the past three years, I have been pleasantly engaged in directing it. The present article is written on the basis of this experience; and, although for this reason lacking comprehensiveness from the general direction finder point of view, will at least furnish the reader with a glimpse of the radio compass in American practice.

We will dispense with the conventional historical background mainly because experience has demonstrated conclusively enough that historical comments have no didactic value and furnish only a nidus for unpleasant controversy. Since the time of Hertz, who undoubtedly used the first direction finder in his classical experiments with electric waves, many minds have contributed in the evolution of the existing device. A bare catalogue of these workers, even if a suitable list was at hand, would probably consume our entire space and even then fall short of doing complete and universal justice.

II.—THEORY OF OPERATION OF THE IDEAL DEVICE.

In order to understand the principles upon which the radio compass operates let us consider briefly the radiation of electric waves from the simple vertical wire system portrayed in Fig. 1.

Fig. 1.—*Electric and Magnetic Forces in Wave from Vertical Antenna.*

When excited the antenna radiates electric waves into the surrounding ether. The peculiar structure of these waves is well known: At some distant point on the earth's surface, the *electrical force* is vertical and the *magnetic force* is horizontal. These forces will be mutually at right angles to the direction of propagation. They may be represented at some instant of time as suggested in Fig. 1. It is to be observed that the magnetic force is normal to the direction of propagation and to the

direction of the transmitting station.

The effect of a wave of this simple type upon a radio compass coil system located at the point may be discussed from either the electrical or magnetic points of view. The magnetic is somewhat more convenient and furnishes a better physical picture. It is well known that when a magnetic flux threads through a coil it induces therein an e.m.f. proportional to the time rate of change of the flux. In the present case of sinusoidal fields, this time rate is proportional to the number of lines of flux which the coil embraces. Suppose that all of the turns on the coil lie in parallel planes. Then if the coil is so positioned that its plane (the plane of the windings) is parallel to the magnetic lines (see A, Fig. 2) none of the lines will actually thread through the coil and there will be no e.m.f. induced. If the coil is rotated so that its plane is normal to the magnetic flux, the greatest number of lines will be embraced and the induced force will be a maximum. This position of the coil in the field is shown at B, Fig. 2.

As the coil is rotated through one complete revolution (360°) the induced e.m.f. is maximum twice and minimum twice. By observing the positions of the coil corresponding to either a maximum or a minimum e.m.f. we can deduce the direction of the flux, and, assuming that the field has not been distorted, we can also find the direction of the transmitter.

In order to perceive these changes in the induced e.m.f. we may connect a suitable detector and telephone set to the coil terminals. A better response will be obtained, of course, if the system is tuned by means of a variable condenser. These connections for a simple type of compass are delineated in Fig. 3.

Fig. 2.—Positions of Coil in Field Corresponding to Maximum and Minimum Induced E.M.F.S.

I have explained very cavalierly what happens when a coil is placed in the path of an electric wave and rotated. This may be summed up as follows: The signal received is maximum when the plane of the windings (or the effective electrical plane when the turns are not regular and in parallel planes) is normal to the magnetic force; and zero when it is parallel to the magnetic force. The application of the device as a direction finder is obvious.

e.m.f. varies as the coil is turned. It is rather apparent that if O represents the angle between the plane of the coil and the magnetic force, the induced e.m.f., E , will vary as the sine of this angle; or

$$E = E_o \sin O \quad (1)$$

This is represented graphically in Fig. 4.

This curve, which represents the mode of variation of E with O , is termed a *characteristic curve*. In the present case, it is a pure figure-of-eight, symmetrical with respect to quadrature axes; therefore, it may properly be termed a *bilateral characteristic*. In cases where the two lobes are not identical, we have

Fig. 4.—Bilateral Characteristic of Simple Coil.

Fig. 3.—Connections of Single Radio Compass.

symmetry with respect to one axis only and the curve may then be termed *unilateral*. Of this I shall have more to say later.

On account of the double symmetry of the simple coil the true or *absolute* direction of the transmitter cannot be determined directly. Suppose it is decided to use the point of minimum signal for taking observations. As the coil is turned, the signals will be extinguished at two points, 180° apart. We are immediately

at a loss to say which one of these corresponds to the absolute direction; we have located the direction of the *line of bearing* but there remains an ambiguity of 180° . All readings taken by this bilateral method of

operation will be uncertain to this extent. In many cases this is not serious; for example, if the station is located on the coast line most of the signals will arrive from the direction of the sea and the inland reading is at once discarded; or if two stations operate co-ordinately, their plotted bearings will converge in the proper direction and the ambiguity is removed at once. The disadvantages of bilateral operation become pronounced, however, in the case of ship installations, and the need for some means of differentiating between the two directions is in many cases keenly felt. A ship getting bearings upon a land station, from an approximate knowledge of her heading, may be able to make a proper discrimination; but when taking bearings upon another ship on the high sea there are few indications as to which of the two readings is the correct one. Many methods of avoiding this dilemma have been devised: and I will discuss one which has been used by the U.S. Navy, and which appears to be well suited for service use.

UNILATERAL OPERATION: If, after we have determined the *line of bearing* by the usual bilateral method, we can destroy the symmetry of the figure-of-eight characteristic, our problem is solved. A suitable destruction of symmetry might consist, for example, in making one lobe of the characteristic larger than the other—or one maximum, so to speak, more maximum than the other. We would then have something like the curve in Fig. 5.

Fig. 5.—Unilateral Characteristic.

This cannot be accomplished, however, without displacing the minima. We care very little about this; after the line of bearing has been determined, all we require is a general intimation of the true bearing. We may arrange the circuit so that the position of the coil corresponding to the greater maximum will indicate the true direction; this done, we proceed to determine the accurate bearing by casting off the imperfection of the bilateral characteristic and investigating this region. The null point, or minimum, is used because it can be located with much greater accuracy than the point at which the signals are a maximum. Two dials, suitably divided into degrees from 0 to 360 are required. These are displaced exactly 90° from each other; one being used for the general direction (when the maximum is used) and the other for bilateral operation (using the minimum).

Any feasible method for producing a recognisable amount of dissymmetry may be used. The one which I propose to describe is shown diagrammatically in Fig. 6.

The antenna consists of a short vertical wire erected along the axis of the coil. The purpose of this is to insure that the phase of the e.m.f. induced is in quadrature with that operating in the coil circuit. Now the

antenna e.m.f. does not vary with the direction from which the waves are arriving. That in the coil does, as we have seen, and reverses when the coil is reversed—that is, turned through 180° . It will be evident that if we add to the coil e.m.f. another e.m.f. in phase and of constant value, we will get an increased effect on one maximum and a decrease on the other. The amount of dissymmetry so produced may be adjusted by altering the value of the extra e.m.f. The antenna supplies this force, and it is introduced into the coil circuit in the proper phase by means of the variable coupling transformer M. A very small amount of biasing force is needed, since the efficiency of the coil itself is quite low; therefore, a short antenna suffices. The coil may be used as its own antenna, with suitable connections. The antenna circuit is preferably tuned to the incoming wave so that the current flowing is substantially in phase with the e.m.f. In Fig. 6 is exhibited a typical unilateral characteristic, biased by this method. The coil e.m.f. is represented by the dashed curve; the antenna e.m.f. by the dotted curve; and the resultant by the heavy curve. Since the e.m.f.'s. are in phase, they are added algebraically. Unilateral compasses of this type are used only on shipboard: as explained previously, the need at shore stations is not great and the bilateral coil is preferred for its simplicity.

Fig. 6.—Arrangement for Unilateral Operation.

III.—THEORY OF THE PRACTICAL DEVICE.

To secure greater clarity in discussing the theory of the simple compass, we have purposely postulated a plane wave acting upon the coil, and a perfect coil system; conditions which are not realised in actual installations. The departures from ideal operation may be divided into two classes—those due to defects in the apparatus itself, and those caused by distortion of the wave. We will further restrict the discussion of the latter class of effects to those produced directly by the environs—in other words, we suppose that the wave is plane before reaching the neighbourhood of the coil.

DEFECTS IN THE APPARATUS: The success of the radio compass depends primarily on two things: securing a strong signal and a well defined minimum, or point of extinction. All bearings are secured by observing the position at which the signal is minimum; hence a perfect minimum* is essential to accuracy. With weak signals, the probable position of the minimum must be judged by rotating the coil to one side until the signal becomes audible and then rotating it to the other side until a signal is again heard and taking the mean of these positions. This interval of silence, the boundaries of which we endeavour to locate by this method becomes smaller as the field strength increases, and, as I shall show in a later section, the accuracy of the observations improves. Not only from this point of view should the signal be strong, but the range of operation is directly affected thereby. With a poorly defined minimum, however, a strong signal is of little value. The strength of the signal for a given field can be brought to its best value by proper circuit design, reinforced by amplification pushed to the practical limit.

* By a *perfect minimum* is meant one in which the extinction is complete, *i.e.*, a real *null* point.

IMPERFECTION OF THE MINIMA: The most significant factor in the destruction of the null point in the practical compass is an effect which I shall term the *antenna effect*. Consider the situation figured below (Fig. 7).

Fig. 7.—Electrical Disymmetry of Compass Circuit.

Here the radio compass is installed over a symmetrical Faraday cage containing the apparatus and operator. This shield protects the parts of the circuit which do not rotate with the coil—leads, amplifier, etc.—from the field; thus errors of this origin are avoided. The terminal of the coil designated by *A* is connected to the filament side of the vacuum tube (amplifier or detector); the side marked *B* is joined to the grid. Now on account of the unequal capacities to earth of the filament and grid circuits, a certain amount of electrical disymmetry exists. The coil, therefore, functions both as an *open oscillator* and a closed one at the same time. When it is placed so that the signal would normally be zero, that is, when the induction into the coil is zero, there remains the effect due to the antenna action. The e.m.f. across the tuning condenser from this cause is usually in quadrature to that due to the normal coil action. The magnitude of this quadrature e.m.f. depends upon the disymmetry. The natural disymmetry caused by the connection of the vacuum tube is unavoidable in practice; and has the serious effect of filling the minimum with signal, thereby dulling it and rendering its precise location difficult.

By restoring the symmetry of the system artificially, the antenna action may be eliminated and all traces of signal at the null point may be removed. This may be conveniently done by connecting a variable condenser between the low capacity terminal and the earth. It should be noted that capacity differences may be brought about in other ways than the one described; a disymmetrical coil, or a coil with unused turns connected to one end, are frequent offenders. Another type of unbalance which causes trouble is that due to unequal leakages between the terminals of the coil and earth. This is more serious since the e.m.f.'s to which it gives rise are not in quadrature with the true radio compass effect; their quadrature components have the effect described while the in-phase parts *shift* the minima. This latter effect is really serious. Leakage may be avoided in properly designed installations; or it may be compensated by an artificial leak, if it is impossible to restore the insulation.

Proper *tuning* of the circuit in the presence of antenna effect is extremely important. Normally, as noted above, the antenna e.m.f. and the radio compass e.m.f. are in quadrature, but if the tuning of the circuit is defective the radio compass e.m.f. across the condenser will depart from this pure quadrature relationship. The result of this is that while perfect null points may be secured by compensation, they will no longer retain their positions 180° apart. This is particularly deleterious because the operator receives a false impression of security from the perfect null points, and has no reason to suspect that they have shifted. I have been unable to secure shifts as large as 10° by improper tuning at standard shore stations. This source of error has been successfully combated by

having the operator first rotate the coil off the minimum until signals are obtained, then tune with the condenser, afterwards back to the minimum and adjusting the compensator until the null point is secured. Since an adjustment of the compensator changes the total capacity across the coil and thus affects the process is repeated; the coil being swung off, retuned, and the minimum, re-compensated. Usually a second approximation sort provides the necessary immunity from minima shifts.

Exact *opposition of the minima* is desirable but not essential for successful use of the compass. In taking the observations the null points is used and so long as its position remains fixed with the plane of the turns there is no difficulty. As a matter of opposition with coils of the single layer rectangular type obtained. There are many reasons for this, chief among them the effect of the spacing of the turns. If this is to be avoided the turns must be close together, or the better method of transposing the turns is employed. In this method the loss in efficiency due to bunching is avoided. The departure of the minima is more pronounced in degenerate coil forms; the so-called "pancake" coil being a case in point; and it is difficult to correct.

Another effect of passing interest in coils of this type is the *spacing between the turns* is an effect which I will term the *effect*. Suppose that the coil is in the position of normal minimum then the true radio compass effect is zero. Now if the turns are a slight reflection shows that there is a loop, closed however by the distributed capacity between the end turns. The result is that across the tuning condenser in quadrature with the radio compass effect (or in-phase with the antenna effect e.m.f.) which reverses the coil is turned from one minimum to the other. At one end the coil opposes the antenna e.m.f.; at the other it aids it. This is the consequence since it is quadrature and causes no shift in the null point; it merely causes the compensation to be different on the two sides.

These are the main effects that are likely to be encountered in installations. There are others, of more or less importance, under peculiar circumstances of installation. No discussion will be attempted because they do not have to be tolerated.

CIRCUIT DESIGN: In a foregoing paragraph emphasis was laid on the importance of securing the best possible signal. This is accomplished in two ways; by amplification and proper circuit design. Both are important; the amplifier does not constitute a panacea since there are practical limits to the number of stages that may be reliably employed. In *audio frequency* systems the number of stages must stop at the point where tube, battery and side noise become unpleasant, and in *radio frequency* systems the number of stages is limited by natural retro-active effects; so that after amplification has reached the limit, further improvements can be effected only by careful design. A great deal might be said on this subject, but in space I shall be able to dwell only on the cardinal considerations.

The amplifier is stimulated by the voltage across the tuning condenser; hence this is to be made as great as possible. The voltage across the condenser, E_c , we have them

$$E_c = \frac{E}{R\sqrt{L}}$$

having the operator first rotate the coil off the minimum until fairly loud signals are obtained, then tune with the condenser, afterwards swinging back to the minimum and adjusting the compensator until a perfect null point is secured. Since an adjustment of the compensator capacity changes the total capacity across the coil and thus affects the tuning, this process is repeated; the coil being swung off, retuned, and after return to the minimum, re-compensated. Usually a second approximation of this sort provides the necessary immunity from minima shifts.

Exact *opposition of the minima* is desirable but not essential to the successful use of the compass. In taking the observations but one of the null points is used and so long as its position remains fixed with respect to the plane of the turns there is no difficulty. As a matter of fact, exact opposition with coils of the single layer rectangular type, is seldom obtained. There are many reasons for this, chief among which is the effect of the spacing of the turns. If this is to be avoided the turns should be close together, or the better method of transposing them may be employed. In this method the loss in efficiency due to bunching the turns is avoided. The departure of the minima is more pronounced in degenerate coil forms; the so-called "pancake" coil being an example of this; and it is difficult to correct.

Another effect of passing interest in coils of this type due also to the spacing between the turns is an effect which I will term the *displacement effect*. Suppose that the coil is in the position of normal minimum signal; then the true radio compass effect is zero. Now if the turns are spaced, a slight reflection shows that there is a loop, closed however, on one side by the distributed capacity between the end turns. The result is an e.m.f. across the tuning condenser in quadrature with the radio compass e.m.f. (or in-phase with the antenna effect e.m.f.) which reverses in sign when the coil is turned from one minimum to the other. At one minimum it opposes the antenna e.m.f.; at the other it aids it. This is of no serious consequence since it is quadrature and causes no shift in the minima; it merely causes the compensation to be different on the two minima.

These are the main effects that are likely to be encountered in proper installations. There are others, of more or less importance, which occur under peculiar circumstances of installation. No discussion of this class will be attempted because they do not have to be tolerated.

CIRCUIT DESIGN: In a foregoing paragraph emphasis has been laid on the importance of securing the best possible signal. This may be accomplished in two ways; by amplification and proper circuit design. Both are important; the amplifier does not constitute a panacea for poor circuit design since there are practical limits to the number of stages that may be reliably employed. In *audio* frequency systems the cascading must stop at the point where tube, battery and side noises become unpleasant, and in *radio* frequency systems the number of stages is limited by natural retro-active effects; so that after amplification has been pushed to the limit, further improvements can be effected only by careful circuit design. A great deal might be said on this subject, but in this limited space I shall be able to dwell only on the cardinal considerations.

The amplifier is stimulated by the voltage across the tuning condenser; hence this is to be made as great as possible. Designate it by, E_c ; we have them

$$E_c = \frac{E}{R} \sqrt{L}, \quad (2)$$

where E is the induced e.m.f., and R the effective resistance of the circuit (including the radiation resistance, coil loss resistance and the effect of the input impedance of the vacuum tube). L and C have their conventional meanings. The expression is true only for mono-periodic fields, i.e., for "arc" signals; when "spark" reception is to be considered the equation for E_c is more complicated, but to a sufficient practical approximation we may use the expression (2). The induced e.m.f. is given by:

$$E = \frac{240 \pi I_{shs} \ln}{\lambda \pi} \sin \frac{\pi d}{\lambda}; \quad C = E \sin \left(ut + \frac{\pi d}{\lambda} \right). \quad (3)$$

For coils of small dimensions compared to the wavelength we may write:

$$E_c = A \frac{n d}{R \lambda} \sqrt{\frac{L}{C}} \quad (4)$$

where A depends upon the field strength at the point where the coil is situated. For shipboard installations the maximum coil section is specified so that the variables under control are the number of turns, the conductor, and the spacing between turns. If operation on a stipulated wavelength is to be attempted, we can design the coil so that E_c is greatest at this wavelength; if some range is desired it is necessary to provide switches to change the number of turns in use so that E_c may be kept high over the entire range. We will suppose that the specified operating wavelength is 800 metres.*

A choice of conductor is first made, giving proper consideration to both its high frequency conductivity and mechanical suitability. In terms of remaining variables we have:

$$E_c = K_1 \frac{n}{R} \sqrt{\frac{L}{C}} \quad (5)$$

L and R are functions of the number of turns and their spacing. C is related to L by $\lambda = a \sqrt{LC}$, so that:

$$E_c = K_2 \frac{n L}{R} \quad (6)$$

We may find experimentally the actual functional relation between L , R and n . After computing E_c from (6) and these results and plotting it as a function of n (including the spacing as a parameter) the optimum number of turns and the proper spacing is easily chosen.

This rather simple example illustrates the general method of procedure. When a number of wavelengths are to be used and the coil section is not restricted, the number of variables is increased and the experimental work is much more laborious. The correlation is, however, quite easily carried out.

INFLUENCE OF THE ENVIRONS: Thus far in order to see more clearly how the operation of the actual compass departs from theoretical expectations, we have postulated that the wave acting upon the coil was undistorted from the plane form; also that the surroundings of the coil were ideal. We have found that the practical coil, carefully designed and installed, and properly compensated, behaves very much like the theoretical coil described in the first paragraphs. Equipped with this information we may examine the effects of the environs.

From this point of view we may define an ideal installation as a coil mounted over an infinite conducting plane. The wave in travelling from

the transmitter to the coil is guided by this plane. Under the and provided also that the coil is sufficiently far removed from the transmitter that the field is substantially pure, the compass true direction of the transmitter. If the source were moved about the coil within sight, and the visual and radio bearings we would probably find perfect agreement between them. are seldom so ideal in practice. The nearest approach to of this kind is a coil installed on a small wooden boat of the "chaser" type and signals travelling across the sea water. C on these boats operate with very small error.

I shall discuss here two types of installation—those ashore (for navigational purposes), and those on board ship. The conditions encountered in each case are widely different; also there is, of course, considerable difference in both the ship and shore installations. On land there are no restrictions and a good site may be selected. On shipboard, on the other hand, there is little choice; a place is found for the apparatus, and the coil is erected over this, usually without regard to the surroundings. It generally finds itself proximate to metallic structures of various kinds, lockers, rails, stays, cranes, and so forth. On shipboard are very unfavourable compared with those at land.

We may look upon the effects of the surroundings as warping or distortion of the wave front. Any change in the medium above the earth, or that of the earth, will have an effect on the wave front. It is well known, for example, that imperfect conductivity in the earth generates a rotating field of the electric force vector to have a radial component in the direction of propagation. This does not effect the compass under ordinary conditions; but any effect which causes the magnetic vector to be rotated component immediately causes trouble. This manifests itself in various ways; by causing the indicated direction of the source to be from the true direction, and in causing an imperfection of the wave from the true direction, and in causing an imperfection of the wave to the land, or encounters the metal ship, or in fact meets obstacles which cause a refraction, diffraction or reflection. We no longer have to deal with one wave, but with several. activated by the primary wave, plus a group of secondary waves. The primary wave may itself have been disturbed. The most general case is a rotating field in space. The indications of the magnetic field in this field is not too large it has no effect of a surface rotation. This reduces the problem to a circular vector in the field generated by the transmitter at O (in an wave this would be the only vector present); and let H' be component due to the scattering, refraction or whatever

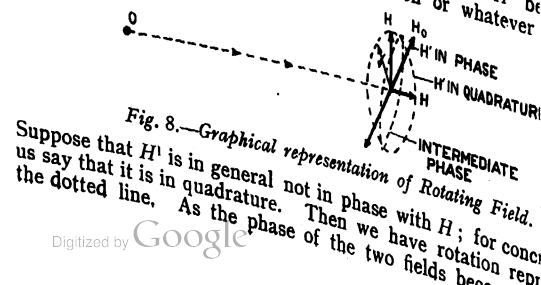

Fig. 8.—Graphical representation of Rotating Field.

* This is, incidentally, the wavelength set aside by the recent International Convention for radio compass work.

the transmitter to the coil is guided by this plane. Under these conditions, and provided also that the coil is sufficiently far removed from the transmitter that the field is substantially pure, the compass indicates the true direction of the transmitter. If the source were moved in a circle about the coil within sight, and the visual and radio bearings compared we would probably find perfect agreement between them. Conditions are seldom so ideal in practice. The nearest approach to a situation of this kind is a coil installed on a small wooden boat of the "submarine chaser" type and signals travelling across the sea water. Coils installed on these boats operate with very small error.

I shall discuss here two types of installation—those ashore (for navigational purposes), and those on board ship. The conditions encountered in each case are widely different; also there is, of course, considerable variation in both the ship and shore installations. On land there are no space restrictions and a good site may be selected. On shipboard, on the other hand, there is little choice; a place is found for the apparatus and operator and the coil is erected over this, usually without regard to its surroundings. It generally finds itself proximate to metallic structures of various kinds, lockers, rails, stays, cranes, and so forth. Conditions on shipboard are very unfavourable compared with those at land stations.

We may look upon the effects of the surroundings as due to a warping or distortion of the wave front. Any change in the conditions of either the medium above the earth, or that of the earth, will in general have an effect on the wave front. It is well known, for example, that imperfect conductivity in the earth generates a rotating field and causes the *electric* force vector to have a radial component in the direction of propagation. This does not effect the compass under ordinary conditions; but any effect which causes the *magnetic* vector to have a radial component immediately causes trouble. This manifests itself in two ways; by causing the indicated direction of the source to be different from the true direction, and in causing an imperfection of the minimum. When the wave is travelling over uneven ground, or passes from the sea to the land, or encounters the metal ship, or in fact meets with any obstacles which cause a refraction, diffraction or reflection of the wave we no longer have to deal with one wave, but with several. The coil is activated by the primary wave, plus a group of secondary disturbances. The primary wave may itself have been disturbed. The result in the most general case is a rotating field in space. If the vertical component of the magnetic field in this field is not too large it has no effect upon the indications of the coil. This reduces the problem to a consideration of a surface rotation. Let H in Fig. 8 represent the normal magnetic vector in the field generated by the transmitter at O (in an undistorted wave this would be the only vector present); and let H' be the radial component due to the scattering, refraction or whatever it may be.

Fig. 8.—Graphical representation of Rotating Field.

Suppose that H' is in general not in phase with H ; for concreteness let us say that it is in quadrature. Then we have rotation represented by the dotted line. As the phase of the two fields becomes more nearly

equal, the ellipse contracts and its major axis changes direction until the point is reached at which they are in-phase and we have simply a non-rotational field represented by the vector H_0 . Now if the coil is orientated in a field of the rotating type in which the phase between H and H' is random, two effects will be discovered; the minima will have been shifted in azimuth and they will be imperfect. The in-phase part of H' causes the shift in azimuth and its quadrature component fills the minima with signal. The quadrature effect may be removed by means of the compensator, which generates a quadrature e.m.f. by antenna action that may be used to oppose the extraneous force.

The only thing of real importance then is the in-phase component of the secondary field. This causes a shift in the minima and so introduces an error in the directional determinations. The difference between the true direction and the observed direction due to these causes is termed the *deviation*.

CALIBRATION: In practice it is customary to determine the deviation experimentally by a process known as *calibration*. The method consists in having a source of radio signals (usually a ship of some kind) to circle about the compass station within visible range, and taking simultaneous visual and radio observations of the direction of this source. The visual observations are taken by means of a transit and are regarded as true bearings; the deviation is the difference between these and the radio bearings observed. The deviations are plotted as a function of the true azimuth (visual bearings); by plotting the observations and drawing the best curve through them. This curve is called the *deviation curve* and is of purely theoretical interest. Another curve in which the radio bearings are used as abscissæ instead of the visual, is derived from this curve and plotted with the sign of the variation reversed. This is called the *correction curve* and is used by the operator to correct the observations in routine work.

Since the accuracy of the bearings furnished by compass stations depends upon the calibration curve as well as upon the accuracy of observation, a great amount of effort has been spent in perfecting the methods of calibration. After considerable testing we have got to the point where this may be regarded as a fine art. The observational error is reduced by securing a strong signal; a 2 kw. source at a distance of from one to three miles has been found sufficient at shore stations. The points of extinction are then not over one-tenth degree in width. The dials are graduated to single degrees and in order to eliminate errors due to estimation of tenths, the dial is set on the even degree and the "mark" signal is given to the transit operator when the signal has become quite inaudible and is just beginning to increase. The transit man keeps the cross hairs upon the main mast of the ship at all times; this being a sufficiently conspicuous part of the vessel. When he receives the "mark" signal from the radio observer he simply stops adjustment and reads the angle. A third man records the data. Readings are taken every degree where it is possible. The vessel now retraverses the path in the opposite direction and another series of readings is taken. It is extremely important that the same path should be followed during the two transits over the working arc; otherwise the data is worthless. The necessity for a double run is this: The type of vessel usually employed in this work has an unsymmetrical antenna of the inverted "L" type. The flat top of this antenna makes an angle at the compass station of the order of one degree. Now when the vessel is so close to the coil, an appreciable radial component (in-phase) exists at the field-point

where the coil is situated. The result is that the coil does not point toward the lead-in of the antenna but to a point in front of it, that is, in a direction opposite to free end. This we may properly term the *centre of radiation*. A theoretical and experimental investigation of the dependence of the position of this centre upon the configuration of the antenna and upon the conductivity of the medium beneath it demonstrates that it lies on the vertical plane of the antenna, but in practical situations the actual displacement from the lead-in cannot be predetermined with any degree of accuracy. By reversing the direction of the ship, thus securing two curves, and taking the mean of these curves as the true calibration curve we can avoid the necessity for knowing where the centre of radiation of a particular antenna lies in relation to the part of the ship (usually the main mast) on which our transit sights are taken. Another advantage of this method is that errors arising from time lag between radio and visual observations and in having the radio observer wait until he is sure that the signal has reached a minimum and is increasing, are eliminated automatically. This seems to be the only satisfactory practical solution of the centre of radiation problem; the ship must be within a short distance of the compass station so that the transit observations may be reliably taken. In actual operation, of course, this is ignored because the angle of displacement is small compared with the natural errors at ordinary distances. With distances of the order of two or three miles, the displacement from the lead-in may attain to values of one-quarter to one-half degree; the error so introduced is quite intolerable.

LAND STATIONS : The environmental conditions at stations located on the coast line are more favourable than those aboard ship; consequently the deviations are smaller, and in general, more regular. The most serious effect encountered at these stations is a variation of the deviations from day to day, or even during the same day. This tendency is revealed by careful calibrations made on successive days under different and identical weather conditions, and also by a study of the operating "logs" of the stations. A complete explanation of this phenomenon has not been found, although it is known that the condition of the soil as affected by the weather has a definite, but by no means, exclusive, influence. Variations take place during periods of unchanged weather conditions. This is one of Nature's pranks and is rather difficult to combat. The only effective practical remedy seems to consist in having the operator observe, at certain intervals, the bearings on fixed transmitters and to make corrections accordingly. If these fixed points are well distributed over the operating sector (which is very seldom the case, the operating sector being for the most part over the sea) the method is good; if not, there is still some information to be obtained about the shifts that have taken place. It has been customary to plot the observed shifts over periods of a month; thus being able to detect any serious abnormalities in the station's performance. A typical record of this sort is shown in Fig. 9, which represents the variations at Cape May, N.J. This is not a particularly bad case; in fact this station is the best on the Eastern Coast of the United States. At some stations the excursions from the means may amount to three or four degrees. The amplitude of these variations obviously partially measures the reliability of the bearings furnished. The curves plotted in Fig. 9 are usually designated as *performance curves*.

The matter of selecting sites for land stations has received a great deal of attention and an extensive investigation has been made in an effort to formulate general methods for determining in advance whether conditions are suitable for compass operation. It is, of course, desirable

to have deviation amplitudes of small magnitude, but it is much more important to have a gradual and regular variation throughout the operating sector. In addition, it is most essential that the configuration producing

Fig. 9.

the deviations should be a fixed one, so that the calibration curves may not change during appreciable periods of time. At present these stations are calibrated at frequent periods of about a month or so, and any changes are detected at these times. It is, however, rather expensive and disconcerting to have this happen after the station has been installed, and by profiting by such experience and by the experimental investigations that have been made, the number of poorly located stations has been considerably reduced. Another matter of interest is the effect of refraction at the shore line. This depends upon the change in the character of the medium at the base of the wave when advancing over the sea it encounters the land. The theory for this has been worked out in detail, but no mention of it will be made here except the remark that refractive errors, depending as they do upon the conditions of the soil, are affected by weather conditions. It is desirable for this reason to locate the station as close to the water's edge as possible. The refraction is not serious, because the deviations

resulting are taken care of by the calibration, but its variation is also advantageous to avoid uneven terrain and, of course, all metallic structures; but if we can be sure that these structures remain unchanged it is possible to approach them quite closely in cases of pronounced necessity.

A typical calibration curve for a land station is shown in Fig. 10. It should be remarked that the deviations represented by the ordinates are not absolute values. It is quite a difficult matter to set the radio coil on the true north-south line; first, because the geometrical plane of the windings is not accurately at right angles to either of these planes; and second, even if this were the case, the setting could not be made unless the absolute value of the deviation was known on at least one azimuth. It might be possible to set the coil by taking observations on a perfectly symmetrical transmitting antenna erected a short distance away and assuming that the waves were undistorted during their progress. This, it should be noted, is a rather bold assumption to make. From a practical viewpoint it makes no difference what the absolute deviations are: all that is required is a correction curve from which true bearings may be derived. The excellent consistency of the observations in this particular curve is notable and reflects creditably upon the calibration technique.

The calibration curves of nearly one hundred land stations calibrated at frequent intervals and the information accruing from research work at other points furnishes a rich collection of data, the study of which has been most helpful in making proper selections of sites for radio compass stations. Whenever possible, the compensation variations as well as the deviations are recorded, and a complete theoretical analysis of the scattering of the radiation is possible.

SHIP STATIONS: After inspecting a typical naval ship installation an unsophisticated person is usually at a loss to understand how the device as a direction finder is used. The coil is generally surrounded by all sorts of metallic

Fig. 10.

resulting are taken care of by the calibration, but its variation is. It is also advantageous to avoid uneven terrain and, of course, all surrounding metallic structures; but if we can be sure that these structures remain unchanged it is possible to approach them quite closely in cases of pronounced necessity.

A typical calibration curve for a land station is shown in Fig. 10. It should be remarked that the deviations represented by the ordinates are not absolute values. It is quite a difficult matter to set the radio coil on the true north-south line; first, because the geometrical plane of the windings is not the electrical plane and the minima are not accurately at right angles to either of these planes; and second, even if this were the case, the setting could not be made unless the absolute value of the deviation was known on at least one azimuth. It might be possible to set the coil by taking observations on a perfectly symmetrical transmitting antenna erected a short distance away and assuming that the waves were undistorted during their progress. This, it should be noted, is a rather bold assumption to make. From a practical viewpoint it makes no difference what the absolute deviations are: all that is required is a correction curve from which true bearings may be derived. The excellent consistency of the observations in this particular curve is notable and reflects creditably upon the calibration technique.

The calibration curves of nearly one hundred land stations calibrated at frequent intervals and the information accruing from research work at other points furnishes a rich collection of data, the study of which has been most helpful in making proper selections of sites for radio compass stations. Whenever possible, the compensation variations as well as the deviations are recorded, and a complete theoretical analysis of the scattering of the radiation is possible.

SHIP STATIONS: After inspecting a typical naval ship installation an unsophisticated person is usually at a loss to understand how the device as a direction finder functions at all. The coil is generally surrounded by all sorts of metallic objects, stationary

Fig. 10.

and movable, each of which in its own peculiar way seems capable of modifying the wave front. It is found, however, that the small objects give rise to no serious deviations if they are at a reasonable distance, say at a distance commensurable with their own dimensions. The predominant effect is that due to the scattering of the waves by the hull and superstructure. The masts, stays and radio antennæ have an important effect also, particularly at wavelengths near their fundamentals.

The hull gives rise to a scattering effect which manifests itself in a tendency for the wave to depart from its path and follow the centre-line of the hull. The deviations generated are of double periodicity, having maximum values off the four quarters, or at angles near 45, 135, 225 and 315 degrees. It is practically zero dead ahead and astern and may or may not be zero athwartships, depending upon the distance of the coil from the centre of the ship. I have examined this scattering theoretically, regarding the ship as an ellipsoid of revolution, and have found an excellent experimental agreement with these results in the case of ships with regular superstructure and at long wavelengths.

A typical ship calibration curve is depicted in Fig. 11. The effect of the hull is clearly discernible. The complete disappearance of the deviation at 90 and 270 degrees does not occur on account of both the disymmetrical situation of the coil and the influence of the main mast and associated stay structures.

Fig. 11.

This curve represents a normal type of deviation which may be compensated artificially. A loop, somewhat larger than the coil may be so fixed that it will, depending upon the arrangement of its associated circuit, absorb or increase the coil energy on certain azimuths and thus restore the true reading. The adjustment is made (and it is only good at one wavelength) by swinging the ship until the signals arrive from off the quarter and then reducing the deviation to zero. The scheme is not practicable for general work over a band of wavelengths, and for that reason is not extensively used.

On shipboard the amplitude of the deviation generally increases with

* Since this was written my attention has been directed to an excellent theoretical treatment of this problem by Comm. Mezny (*Radio Review*, Vol. 1, 11 (1920), p. 532). Regarding the ship as an infinitely long right cylinder, Mezny arrives at very similar conclusions. Cf. J. J. Thompson, "Recent Researches in Electricity and Magnetism," pp 432, et. seq.

decreasing wavelength. The lowest wavelength upon which reliable operation may be attempted is determined by the fundamental wavelength of the main ship's antenna, *ungrounded*. This is nearly one-half its fundamental grounded, since it then acts very much like a Hertzian half-wave oscillator. It has not been found beneficial to load the antenna to a very high wavelength and ground it, in order to operate the compass at short wavelengths; the reason for this is obvious. If there is no antenna aboard the ship, the minimum wavelength may be reduced until the period of masts and stays is reached.

So long as the contour of the superstructure remains unaltered and the deviations evaluated one day may be used on the next we care very little whether their maximum amplitudes are 1° or 30° and there is little point in a painstaking investigation of the causes.

IV.—THE EFFECT OF THE DETECTOR CHARACTERISTIC UPON THE DEFINITION OF THE MINIMA.

In a preceding paragraph it has been shown that for small angular displacements the e.m.f. across the condenser varies directly with the angle from the true null point. Our sense impression, however, depends not upon this e.m.f., but upon the detected result of it; hence, the character of the minimum is determined by the *detector characteristic*. Let us define this characteristic by a general expression of the type.

$$R = \alpha e^n, \quad (7)$$

where R is the response, measured in any convenient way—by amplitudes of vibration of the telephone diaphragm, terminal voltage, current through the windings, audibility, etc.— e is the stimulus, identified in the discussion with the condenser voltage; α is the "detection coefficient"; and n is an index which is assumed to be constant over a small range of e about the null point. The relation between R and e defines the *stimulus-response characteristic* of the system.

Let us suppose that R is measured by the movement of the telephone diaphragm. The mechanism of audition appears to be amenable to the following description.

In Fig. 12 the sense impression derived from a sound stimulus is suggested graphically. As the stimulus is increased nothing happens at first, but soon a point is reached at which the sound becomes audible. This point may be called the *threshold stimulus*. Further stimulus increases the sense impression. Now if we let the stimulus be decreased it is found that the impression persists *below* the threshold point, the ear acting almost as if some inertia effect were present. The point at which the signal has died out completely may be termed the *minimal stimulus*. This explanation of the audition characteristic is purely empirical and, so far as I am aware, has no sound physiological or psychological foundation. It is, however, well in accord with experience and will serve our present purpose.

The operator, in excursing from one side of the minimum to the other, automatically corrects for this inertia effect. The mean position which he

Fig. 12.—Illustrating Inertia in Audition.

selects as the most probable minimum is symmetrical with respect to each point. It makes little difference, then, which stimulus point we employ in the following discussion.

Let us suppose that Fig. 13 represents conditions in the region of the minimum. The abscissæ are angular displacements on either side of the minimum. This is a graph of the stimulus-response characteristic, and of (7). Let R_0 represent the diaphragm movement for threshold audibility and e_0 the corresponding stimulus. The zone of silence is $2e_0$ in breadth. The accuracy with which the points e_0 may be located depends apparently upon the rate of exchange, dR/de , close to this point. But the final accuracy is not determined entirely by this. It has been discovered, as a result

Fig. 13.—Characteristics at Minimum Point.

of a laboratory study of audition with a number of different observers, that the ability of the operator to locate the exact mid-point of the silent zone, falls off as the zone widens. This occurs almost hyperbolically at first, becoming rather less marked as the zone width increases. Operation is seldom attempted with large zones, so we may assume an inverse relationship here. The accuracy of observation may be defined then by combining these notions. Denoting this by M , it has the form:

$$M = \frac{\left(\frac{dR}{de}\right)e_0}{R_0} = n^a \sqrt{R_0^{n^2 a^2}}, \quad (8)$$

where R_0 is the threshold audibility; and n , a have their assigned meanings.

We may divide the possible signals into two types; undamped, or "arc" signals, and "spark" signals. All modulated wave types will be excluded from consideration on account of their decided unsuitability for these purposes. Two methods are customarily employed for the reception of "arc" signals—the heterodyne method and the autodyne method. Spark signals are received either in the ordinary way—that is, with straight detection (with or without an interposed radio frequency amplifier)—or by regeneration with a rough note.

In Fig. 14 are shown representative stimulus-response characteristics for the several methods of reception, with both types of signal. The "arc" response is nearly linear ($n=1$); the ordinary detection is closely a second order effect ($n=2$); and the index for the "rough note" regenerative reception has an intermediate value. From (8) we find that

$$M = \frac{a^2}{R_0} \quad \text{"arc" signals} \quad (9)$$

$$M_s = 2a \quad \text{"spark signals"}$$

If we legitimately broaden the meaning of a we observe that the accuracy increases in both cases with the signal strength (measured by e_0), its amplification previous to detection and the efficiency of detection. For spark signals the accuracy appears to be independent of the threshold stimulus (R_0). The derivative $\delta M / \delta n$ is zero for $n=2 \log a/R_0$ and an increase or decrease of the accuracy with n is determined by the ratio a/R_0 . By virtue of the natural amplification available by the heterodyne or autodyne methods of reception in the case of "arc" signals, and the rough note regenerative method in the case of spark signals, it is necessary to

reinforce the ordinary detection by several stages of pre-detection radio frequency amplification before the α becomes sufficiently large to permit comparison of the three systems. In practical apparatus I have found $2 \log \alpha/R_0$ to be much greater than the highest index n with which we have to deal, so that we make the deduction that the accuracy increases as the index of the system decreases. This implies, of course, an equality

Fig. 14.

of ϵ_c in the three cases. Arranged in the order of merit then are the "arc," spark (rough note detection), and ordinary spark detection with high-frequency amplification. Arc signals are objectionable on other grounds. They are difficult to work with, to tune and to maintain a steady beat note during orientation of the coil and are more amenable to nocturnal variation than are the more heterogeneous spark signals. Rough note reception of spark signals, the next in order, does not recommend itself when interference is to be encountered. At isolated points where the direction finding traffic is light, this method is pre-eminently satisfactory. For general work under average conditions we find, that in spite of its inferiority from the above point of view, that the ordinary detection method with spark signals (preceded preferably by a maximum of radio frequency amplification) seems to be most suitable.

In conclusion I may remark that we have in brief, space succeeded only in scratching the surface on an immense and intensely interesting subject. Not only for its own sake is this research of value, but also because of the very nature of the investigations they constitute important contributions to the more general theory of electro-magnetic wave propagation over the surface of the earth. I have endeavoured in presenting a tolerably comprehensive outline of radio compass operation in both its practical and theoretical aspects, however discursively and cavalierly, to avoid those extravagant remarks that an enthusiast is so likely to make, and to adhere as far as is consistent with the demands of sufficiency and cursive exposition, strictly to a policy of mentioning only those developments that I have been permitted to make.

HISTORICAL LANDMARKS IN WIRELESS INVENTION

BY PROFESSOR G. W. O. HOWE, D.Sc.

ONE could probably adopt no course more likely to lead him into trouble than to attempt to allocate merit between the various members of that great army of scientific workers who, as the result of their collective activities, have developed the art of radiotelegraphy from its earliest beginnings to its present condition, and yet, when the writer was asked to contribute an article to the *Year-Book*, dealing with the development of Radiotelegraphy from the point of view of those inventions which have proved to be of most importance in that development, he consented to do so because he felt that such an article should be of great interest to everyone connected with the subject, and more especially to the many younger men who find it difficult to picture a world unprovided with thermionic valves. Looking back ten or twenty years it is a far easier matter to judge an invention as regards its importance in the development of the subject than as regards the merit due to the inventor, because to do the latter it is necessary to clear one's mind of all subsequent knowledge and put oneself in the position of the scientific worker of that date. In the present article an invention is regarded from the point of view of its ultimate importance in the line of development, rather than of the merit of the invention in itself.

The fundamental invention of radiotelegraphy was made by Hertz in 1887. Helmholtz had suggested to him, as a subject of research, the experimental confirmation of Maxwell's theory of the displacement currents in dielectrics, and he had devoted much time in a vain endeavour to establish an experimental proof. He was engaged in other experiments when he noticed certain things which many scientists would have passed over but which he was quick to recognise as an important step along the road which he had trod so patiently; he was thus led to make his classical experiments on the production and detection of electromagnetic waves. These experiments are almost unique in the novelty of their inception, and in the systematic confirmation of theoretical hypotheses. They are also unique in their rapid development to a branch of electrical engineering which has revolutionised the intercommunication between the peoples of the world.

The two names which stand out in immediate succession to Hertz are those of Lodge and Marconi. Sir Oliver Lodge had already made many experiments with electrical oscillations and was able to appreciate fully the scientific import of Hertz's work. Marconi had the imagination to see, if only very hazily, something of the possibilities of this new discovery; he also had the initiative and the power of application to put his ideas to the practical test and, whether fortune smiled or frowned, to persevere in the accomplishment of his purpose. His patent, No. 12039 of 1896, is in the main an application of a Hertzian radiator of large size and a similar receiver with a filings coherer as the detecting device. It is interesting to note that after describing a horizontal radiator of the type used by Hertz, except that the metal plates were of large size and supported on poles, the

inventor says that where obstacles such as many houses or a hill or mountains intervene, "I have devised and adopt the arrangements shown in Figs. 10 and 11—i.e., a vertical radiator with one terminal of the wire joined to an elevated capacity area and the other terminal earthed. It is not very obvious why this superior arrangement was not to be used in all cases. Lodge's patent, No. 11575 of 1897, shows a remarkably clear insight into the problem of tuning and selectivity. It constitutes a great advance on Marconi's patent of the previous year in its clear statement of the scientific principles involved and the *modus operandi* of the production and reception of the electromagnetic waves. It describes the insertion of an aerial tuning inductance, not only for the purpose of tuning the two stations to the same frequency, but also for the purpose of reducing the decrement and thus causing the wave trains to be prolonged so as to make sharp tuning possible and thus receive the desired signals without interference. The advantages of a vertical radiator, either with an insulated counter capacity or with an earth connection, are clearly stated to consist in reduced absorption and uniform horizontal radiation.

In describing the steel point coherer a remark is made which was many years in bearing fruit, viz., "When a telephone is used I find that the coherer restores itself sufficiently without specially arranged tremor (decoherer) and that a telephone is the quickest responder that can be used." Apparently, however, it was considered essential, at that time, that the message should be recorded by some type of ink and some years elapsed before telephone reception became general.

In 1897, then, we had the vertical aerial which Marconi had shown should be high and provided with upper capacity, and which Lodge had shown should be tuned and given as small a decrement as possible. Whether it should be earthed or provided with a counter-capacity we now know to have been a relatively secondary matter in the stations then in use.

The next great step was the invention of the tuned coupled aerial which was described in the celebrated patent No. 7777 of 1900. The provision of a path between the aerial and earth other than that through the spark gap was not new. Braun, in patent No. 1862 of 1899, had placed the gap in a primary circuit coupled to the aerial but had not apparently realised the great advantage of loosely coupling the two circuits and tuning them to the same frequency. Tesla had used somewhat similar arrangements many years before but not in connection with wireless telegraphy. The tuning of the four circuits, viz., the spark-gap circuit, the transmitting aerial, the receiving aerial and the detector circuit, is clearly described and discussed in the Marconi patent, from which we quote the following: "The circuit of the elevated conductor should be suitably attuned for this purpose. The four circuits, viz., those including the primary and secondary of the transformer in the transmitter, and the primary and the secondary of the transformer in the receiver should be so adjusted as to make the electric time period the same in each. But in lieu of the time periods being the same they may be harmonics of each other." This represented a great advance as is sufficiently evidenced by the litigation and claims for priority which have centred around this patent. Most German writers have persisted in calling the plain aerial with the spark-gap between it and the earth a "Marconi" aerial, to emphasise their claim of the coupled aerial for Professor Braun.

Not only in his classical researches with the Tesla coil may Tesla claim to have paved the way for advances in wireless telegraphy. An invention of great practical importance for the development of the subject was made about the same time as the earliest experiments of Marconi. We refer to the invention by Tesla of the synchronous discharger as described in his patent specification No. 20981 of 1896. This is of great interest on account of the clear description at that early date of the process of tuning and of the adjustment of the phase of the discharge by moving the stationary electrodes of the gap. His claims cover the use of a rotating discharger with either a continuous or an alternating source. In the D.C. case he describes the tuning to synchronism with the natural frequency of the charging circuit and the adjustment of the output by controlling this natural frequency or the speed of the discharger. In the A.C. case he describes the adjustment of the position of the fixed terminals of the spark-gap in order to cause the spark to occur at the correct phase moment. In the case of a D.C. supply he says: "A very slight variation in this respect by disturbing the relations between the rate of impressed impulses and the vibration of the circuit of high self-induction into which they are directed, caused a marked departure from the condition of resonance and a corresponding reduction in the amount of energy delivered by the impressed impulses to the apparatus." Naturally, he does not mention radiotelegraphy, but he says that his apparatus is "for converting electric currents of the kind generally obtainable from municipal systems of electrical distribution into currents of high frequency." As a further indication of Tesla's insight into the processes involved we quote the following: "In order to charge alternately a given circuit of this character by periodic impulses impressed upon it and to discharge it most effectively, the frequency of the impressed impulses should bear a definite relation to the frequency of vibration possessed by the current itself. . . . When the conditions are such that the general law of harmonic vibrations is followed, the circuits are said to be in resonance or in electromagnetic synchronism and this condition of the system is found to be highly advantageous." Here one has, in 1896, the synchronous discharger with adjustable electrodes and instructions for tuning the low-frequency circuit to resonance with the discharger, all ready to be incorporated without any alteration in the transmitting system of a wireless telegraph station.

It was some years, however, before the power employed in wireless telegraphy, and the spark frequency were increased to such values that one gave up the fixed gap and adopted the invention of Tesla. It is interesting to note that in the first edition of Professor Fleming's *Principles of Wave Telegraphy*, published in 1906, the synchronous discharger is not considered, but a fixed gap shown even for the highest powers then in use. When once adopted, however, it very quickly became the standard type of gap, except in systems employing the quenched spark. An important link in the chain of development was the abandonment of the coherer and inker in favour of telephonic reception. The loss of the printed record was far more than compensated for by the power of discriminating between the signals and extraneous disturbances from other stations and from atmospheric effects. It emphasised the importance of tuning, of correct coupling and of uniformity of sparking at a high acoustic frequency, in order

to obtain a musical tone clearly distinguishable from atmospheric disturbances.

Although the use of a telephone receiver in conjunction with a carbon detector had been known since 1896, and although Neugschwender had invented his electrolytic detector in 1898, it was not until 1903 that the coherer and inker were definitely replaced by telephonic reception. The Marconi Company adopted the magnetic detector in the beautifully simple form which they had patented in 1902. One must remember, however, that a type of magnetic detector had been devised and used by Rutherford in 1895 to detect the radiation from a Hertz radiator at a distance of half a mile across Cambridge. Subsequent research had been carried out by Wilson and others. One cannot conceive a simpler form of detector or one requiring less adjustment and maintenance than the Marconi magnetic detector. It was for many years the only detector carried on the majority of British ships. It was not highly sensitive, but in reliability it left nothing to be desired.

The Telefunken Company gave up the coherer and inker at about the same time and adopted the electrolytic detector in the form designed for them by Schlömilch. Here, again, many scientists had investigated electrolytic detectors of various types, and it is a matter of great difficulty to say to whom the credit is mainly due. General Ferrié had experimented before 1900 with a type very similar to that ultimately adopted by the Telefunken Company and many others.

Other types of detectors followed. It had been known that certain crystals possessed unilateral conductivity, that is, they offered a lower resistance to current in one direction than to current in the reverse direction. They could, therefore, be employed as rectifiers of the high-frequency currents in the receiving circuits if they still possessed this property at these high frequencies, which was found to be the case. Three names stand out with special prominence in the invention of detectors of this class. Pickard's patent, No. 836531 (U.S.A.) of 1906, is for a detector of silicon and copper, Dunwoody's, No. 837616 (U.S.A.), of 1906, is for a non-metallic crystal, viz., carborundum. During the years 1906 and 1907 Pickard and Pierce took out a number of patents as they found one thing after another capable of being employed as a detector. In most of these it was found preferable not to employ the simple rectifying property by virtue of which the current in one direction experienced a greater resistance than that in the other, but to make use of the fact that, as the current in one direction was varied in magnitude, the contact did not obey Ohm's law, or, in other words, the characteristic was curved. The increased sensitiveness was usually sufficient to compensate for the necessity of using a cell and potential divider. For long distance work the crystal detector in some form or other largely replaced the magnetic and the electrolytic detectors, and although most crystal detectors required very careful adjustment at frequent intervals and were put out of action by a heavy atmospheric, it was possible with others, especially with carborundum, to obtain great reliability with a fair degree of sensitiveness.

Another invention which preceded that of the crystal detector was the Fleming valve. Although the rectifying property of this valve had been known for many years and had been investigated by a number

of scientists, especially by Prof. Fleming himself, the suggestion that it could be used as a detector in wireless telegraphy was first made by Fleming in his patent No. 24850 of 1904. Although in the patent the inventor describes its use as a simple rectifier; that is, by virtue of its ability to pass current in one direction and not in the other, it was usually employed in practice in the other manner mentioned above in connection with crystal detectors, that is, with a steady current flowing through it of such a magnitude that it was at a point of sharp curvature on the characteristic. Although possessing reliability and fair sensitiveness, it did not displace the magnetic detector nor the crystal detector, except in special cases. Its great service to the art of wireless telegraphy was in acting as a forerunner to the three-electrode valve.

It will thus be seen that the period 1902-1906 saw the invention of a number of detectors of different types. Although during this time little progress appears to have been made in methods of generating the electromagnetic waves with the aid of spark gaps, a method was invented of producing undamped or continuous waves. It was in 1900 that Duddell discovered that the electric arc was capable of generating alternating currents; he used ordinary carbon electrodes in air and found that the frequency of the currents could not be raised above the audible range. Poulsen's modifications which transformed the Duddell arc into an efficient apparatus for the production of undamped alternating currents of radiotelegraphic frequencies were embodied in his patent No. 15599 of 1903. It was in 1906 that Poulsen demonstrated his arc in operation at the Queen's Hall in London to a large assembly of scientists and interested persons. The chairman at that gathering with an optimism, real or assumed, which events certainly did little to justify, informed the meeting that they had met that day to sound the death knell of the spark. The arc made it possible to obtain tuning of a sharpness far beyond anything obtainable with spark-gap circuits, but such sharp tuning called for a constancy of frequency which was difficult to obtain with the arc as then made. Ten years had to pass, and Poulsen's patent near its expiration, before the arc was adopted to any considerable extent as a generator in radiotelegraphy. Its ultimate adoption was due partly to the successful operation obtained with relatively large powers, but to a greater extent to the development of new methods of reception specially applicable to continuous waves. It is worthy of note that the arc generators being constructed at the present time for 500 and 1,000 kilowatts contain no essential modification from Poulsen's original invention. They differ merely in size and in constructional detail. In the water-cooled anode, the hydrocarbon atmosphere and the transverse magnetic field Poulsen had combined all the modifications essential to successful operation.

As we have said, with the exception of the Poulsen arc, the period 1902-1906 was mainly conspicuous by the development of means of reception; the next few years, however, saw a transformation in the methods of generating the high-frequency currents. Up to this time the spark-gap had had fixed electrodes separated by a considerable distance, sometimes enclosed in gas or compressed air, but more often open and subjected, in some cases, to an air blast. In 1908 von Lepel introduced a new form of spark-gap consisting of two metal plates separated by a sheet of paper with a hole in it. This was generally supplied from a continuous current source, the spark frequency being

dependent on the constants of the electric circuits. This system was described in patent No. 17349 of 1908 and was installed at Slough where it was seen in operation by many wireless engineers. For the first time wireless operators heard clear high-pitched musical notes in their receivers and were at times given the National Anthem and other airs played on a keyboard at Slough, by means of which the circuits were adjusted to give a regular scale of spark frequencies.

The Telefunken Company, after investigating the Lepel system, took out patent No. 6424 of 1909 for their well-known quenched spark-gap consisting of copper discs preferably faced with silver, with a very small separation between the parallel faces of adjacent discs; the number in series depended on the power of the station. Instead of paper, which in the Lepel gap was slowly burnt away, the Telefunken Company used rings of mica which served both to insulate and to maintain the spacing and also to enclose the sparking space, but which were separated from the actual spark by a groove in the face of the electrode. The quenching action of short gaps and its relation to the coupling was first studied and clearly explained in 1906 by Max Wien, using an ordinary open gap between spherical electrodes, but it was only by using a gap of the Lepel type that the principle was embodied in a practicable spark-gap. The quenched gap has been adopted by many companies, and when properly designed and employed in a suitable circuit, gives a musical note of a uniform and pure tone; it has the advantages of being noiseless at the transmitting station and allowing the high-frequency circuit to be arranged quite independently of the position of the running machinery.

At the same period that the quenched gap was being developed and introduced by the Telefunken Company, other companies generally adopted the synchronous gap originally devised by Tesla, the object being to obtain uniformity of sparking with a large number of sparks per second. The appreciation of the benefit of using a high spark frequency is indicated by a peculiar patent, No. 13865 of 1908, granted to Fessenden for the use of a spark frequency exceeding 250 and especially for one of about 1,000 per second.

No striking developments occurred during the period 1908-1914. There was a gradual increase in the wavelengths employed for long distance transmission and also in the power which was considered necessary to maintain such communication. Quenched gaps and rotating synchronous gaps were designed to deal with these large powers. The Poulsen arc made a little progress on the Pacific Coast of the United States. Since 1914, however, the whole art of wireless telegraphy and telephony has undergone a transformation, due not so much to new inventions made during this period as to the discovery of the wonderful possibilities which lay dormant in an invention made several years before. No single invention has done more to revolutionise radiotelegraphy than that of the audion. Little did Dr. de Forest imagine, when he placed a control electrode first on the outside of the bulb of a Fleming valve and then inside the bulb as a grid between the anode and cathode, that he was making the most important step in the whole history of radiotelegraphy, but that such was the case no one can now have the slightest doubt. The first suggestion of a three-electrode valve is made by de Forest in a paper read before the American Institute of Electrical Engineers in 1906, where he says: "It is not necessary to connect the anode to a terminal of the oscillating

circuit; one terminal may be attached to a metal sheath or ring surrounding the glass vessel. . . . This latter type of audion is the one I have found most serviceable in practice." In a patent taken out later in 1906 he places the control electrode inside the bulb, but as a plate behind the filament. On the 29th January, 1907, Dr. de Forest applied for a patent for the grid placed between the filament and the anode and thus gave the audion the form in which we now know it. In the same patent is shown the method of receiving by inserting a condenser in the grid lead, now so commonly employed. Development proceeded slowly from 1907 to 1912; the behaviour of the audion was uncertain because of the poorness of the vacuum and it was questionable whether any advantage it had as a detector over the much simpler crystal was sufficient to outweigh its cost, uncertain life, auxiliary batteries and resistances. It is a strange and noteworthy fact that the British patent was allowed to lapse.

Although slowly, progress was being made both in the United States where de Forest developed the use of his three-electrode valve as an amplifier, and in Germany where von Lieben and Reisz were working along the same lines with a valve of very different construction. The use of a three-electrode valve as an amplifier may almost be said to be older than the three-electrode valve itself. In his German patent, No. 179807 of March, 1906, von Lieben claims the invention of "A cathode ray relay for oscillating currents up to the highest frequencies, in which slow cathode rays emitted in the known manner by a concave cathode coated with glowing metal oxide, are so controlled by the oscillating current to be amplified that they produce in their circuit oscillations of the same frequency but of greater amplitude." Lee de Forest's invention of the three-electrode valve provided at once a means for carrying out this amplification in a practical and simple manner. The development of the valve owes much to the work of Longmuir on the production of high vacua; with the practical elimination of the remanent gases and improved methods of construction, the audion became a reliable piece of apparatus which could be manufactured with the same degree of certainty as to its characteristics as an electric lamp.

There are apparently several claimants to the invention of the three-electrode valve as a generator of oscillations. During the years following 1907, in the course of experiments on the use of the valve in various circuits, cases would undoubtedly arise in which oscillations might occur and probably did occur, much to the disgust of those desirous of developing a reliable amplifier, but to Meissner is apparently due the credit of first introducing a magnetic back coupling from the anode to the grid circuit for the express purpose of maintaining oscillations. This experiment was made in 1913 and is described in British patent, No. 252, applied for in January, 1914. The idea of adjusting the back coupling so that the oscillations are almost maintained and thus decreasing the effective damping of the receiving circuit is due to Franklin who clearly describes this in his patent, No. 13636 of June, 1913, although we now know that there is always a certain amount of coupling between the two circuits owing to the internal capacities of the valve itself. Dr. de Forest was early in the field with an oscillating valve set connected up in a way which he had found to give great sensitiveness in detection and to which he had given the name *ultraudion*. It is noteworthy that in a paper on the heterodyne method of reception,

read before the Institute of Radio Engineers in 1913, there is no mention of the possibility of using a three-electrode valve as a generator, although in another paper at about the same time de Forest mentions the precautions necessary to prevent a two or three valve amplifier from singing.

The invention of the heterodyne method is due to Fessenden, who first suggested sending out too slightly different wavelengths from two transmitting aërials; he then, at a later date, introduced the locally generated current of a frequency differing slightly from that of the received current, but proposed to utilise the beats to act directly on various forms of electromagnetic and electrostatic telephone receivers, without any detector in the usual sense. The difficulties of heterodyne reception due to the want of a suitable local generator were such that continuous wave signals were received by the "tikker" until 1914, except for a few isolated experiments in which a small arc was employed.

The three-electrode valve has not only given us a new method of generating high-frequency currents for the production of electromagnetic waves at the transmitting station but has also led to a great development of all other methods of producing high-frequency current. For the production of continuous waves there were several methods available, but in all cases development was hindered by the difficulties experienced in impressing an acoustic frequency upon the continuous waves or upon the received signal which was otherwise inaudible. The advantages of the heterodyne method of reception were realised but could not be conveniently realised because of the lack of any thoroughly reliable and simple source of high-frequency current to superimpose locally upon the receiving signals. The three-electrode valve revolutionised the reception of continuous waves and consequently gave an impetus to methods of producing them. The Duddell-Poulsen arc has been built in ever increasing sizes without, however, any modification except in details of construction. The direct production of high-frequency current by means of an alternator of the appropriate frequency must appeal to the electrical engineer as, in many ways, the ideal solution of the problem. The difficulties, however, are very great, and various ingenious methods have been invented for overcoming them. Goldschmidt's invention in 1911 created great interest, but only two or three stations have been equipped with this system. Any single-phase alternator induces in its field circuit an alternating current of double the frequency of the armature current, and this double frequency current superposed upon the continuous field current causes a third harmonic current to be induced in the armature which induces a fourth harmonic current in the field circuit. These harmonic currents are usually negligible, but Goldschmidt, by turning the various circuits to the appropriate frequencies by means of condensers and inductances, caused these currents to build up to an extent limited only by unavoidable losses and thus supplied to the aerial a current of 40,000 cycles per second from an alternator of 10,000 cycles per second.

Another method for obtaining the same result in an entirely different way consists in utilising the distortion produced in the magnetising current of a transformer owing to the saturation of the iron. This was not originally invented for the purpose of radiotelegraphy or even of high-frequency currents, and many names are associated with the

discovery and development of various methods of utilising the phenomenon of saturation for the multiplication of frequency, notably, Clinker, Epstein, Joly and Vallauri. The development of the system for high-powered wireless transmitting stations is due to the Telefunken Company, who have equipped several stations on this system, notably their large station at Nauen.

The development of alternators capable of generating efficiently several hundred kilowatts at a frequency of 30,000 cycles per second is a matter of great mechanical and electrical difficulty, but these difficulties are greatly reduced if the wavelength is increased to say 30,000 metres and the frequency, therefore, reduced to 10,000 cycles per second. The design of large machines, capable of generating current at frequencies between 20,000 and 30,000 and suitable, therefore, for supplying the aerial without the intervention of any frequency multiplying device, has been developed both in America and in France, but without producing any invention of striking novelty or importance, although great ingenuity has been shown in overcoming the mechanical difficulties.

Directive telegraphy may be subdivided into the transmission of waves predominantly in certain directions and the determination at the receiving station of the directions of the arriving wave. The earliest invention in directive transmitting was that of S. G. Brown, in 1899, who described, in patent No. 14449, the effect of having two aerials supplied with currents of suitable phase difference. The only important modification of this principle is the bent aerial of Marconi, the action of which is of a very complex nature. Directive reception by using S. G. Brown's double aerial would necessitate rotating the aerials to receive stations in various directions; this was obviated by the invention, in 1907, of the radio-goniometer by Bellini and Tosi. The use of a small rotatable coil may be said to have originated with Hertz, who used a closed coil as a receiving circuit and showed that its response depended on its orientation. In its modern form Pickard employed the direction finding coil with tuning condenser and detector in 1907. Modern development has been due almost entirely to the increased sensitiveness obtainable with three-electrode valve amplifiers and detectors.

In wireless telephony, invention has been devoted to two distinct problems, namely, the production of a pure undamped wave, and the modulation of the radiated power. The former is now common to telephony and telegraphy. The earliest experiments were made with sparks following one another at a frequency above the acoustic range; experiments were also made with high-frequency alternators, but the major part of pre-war radiotelephony was done with the Poulsen arc. The advent of the valve oscillation generator has revolutionised the whole problem and it will undoubtedly lead to great developments. In the second field of research great ingenuity was devoted to the design of a microphone capable of controlling directly the large powers required. The only outstanding inventions were the liquid microphones of Majorana and Vanni. These, like so many things, have been rendered obsolete by the thermionic valve, which not only produces the oscillations but which immediately suggests the application of its amplifying properties to the modulation of the output of the generating valve. Another ingenious device is that of using the microphone current to vary the permeability of the core of a coil, either directly or

through a thermionic amplifier; the variations of permeability cause variations of inductance and thus affect the tuning of the circuit containing the coil, which circuit may be the radiating antenna. This application is due to Alexanderson, who described his magnetic amplifier in 1916. If the antenna is supplied through a frequency doubling transformer the permeability control can be introduced in the transformer, thus modifying the double-frequency output. This method is due to Kühn, of the Telefunken Company, and has been used in 1913 in telephony experiments between Berlin and Vienna.

In concluding this review we realise that a vast amount of research, discovery and invention has been passed over without mention. We can only pretend to have reviewed those outstanding discoveries, which to one looking backwards, seem to stand out as essential links in the chain of progress which has led from the experiments of Hertz to the present state of the art.

VALVE AMPLIFIERS FOR SHIPBOARD USE

BY F. P. SWANN.

IN the *Year-Book* for 1920, the factors which governed the design of the three-valve amplifier for shipboard use were discussed at some length. At that time the four-electrode valve and its circuits were only in the embryo state, but amplifier requirements were so immediate that one had to be designed at once from the knowledge then available. It was recognised, however, that this design would only be a temporary measure, for the maintenance of the resulting three valves with their attendant heavy filament current would of necessity prove to be a heavy item. Work, therefore, was commenced with a view to the production of a valve which would be much more robust than the existing forms of receiving valves, have a longer life, and the use of only one of which would give the same results as those obtained by the three valves in the Type 71. The present four-electrode valve and its accompanying circuits was the final result, and the amplifier which we are about to describe was designed along

Fig. 1.

Fig. 1a.

similar lines to those of the Type 71. In order to gain a clear appreciation of the manner in which it is functioning, it will perhaps be best to start with the simplest circuit of the three-electrode valve, and follow the development from that. Before doing this, however, an explanation will first be given of the manner in which a valve acts as a rectifier.

In Fig. 1 OGST represents an imaginary characteristic curve of a three-electrode valve (anode current plotted against grid volts). Such a curve would be an ideal one from a rectifying point of view, and we will assume that we have such a curve at our command, as this will simplify the explanation a little. Fig. 2 shows a tuned aerial circuit coupled to a tuned closed circuit, and from the aerial current induced by the signal, oscillating currents are produced in the closed circuit. Across "AB," therefore, we have a sine wave alternating E.M.F., which is represented by the sine curve in Fig. 1. As shown in Fig. 2, "A" and "B" are connected to the grid and filament (*via*

the potentiometer) of the valve. The potentiometer is adjusted until the grid is "OG" volts positive, for any increase in grid volts above this value causes the anode current to commence very abruptly. Now it will be seen that the positive half of the wave, or signal curve,

Fig. 2.

Fig. 3.

will take the grid volts up to "OP," and the negative half will reduce them to "ON." The increase "GP" of grid potential will cause an anode current of value "OD" to flow, but the decrease "NG" produces no change at all in the anode current, therefore the whole of the positive half of the curve will be utilised in producing an unidirectional pulsating current in the anode circuit, having a maximum value "OD." This is shown in Fig. 1a.

Now let us assume that the rate of increase of anode current with increase of grid volts is as shown in Fig. 3. In this case the increase in grid volts "OA" produces no anode current, but from "A" to "G" the anode current rises at a certain rate, and from "G" to "S" rises at a very much greater rate. Now by means of the potentiometer let us set the grid potential to "OG," and, as in Fig. 1, let the sine curve represent the signal volts. The positive half of the curve takes the grid volts to "OP," and causes an increase "ED" in the anode current.

Fig. 3a.

Fig. 4.

The negative half of the curve reduces the grid potential to "ON," and causes a decrease "EO" in anode current. The resulting anode current is shown in Fig. 3a. In Fig. 1a the effect in the telephones would be the summation of the pulses over the length of a wavetrain,

and it is the same in the case of Fig. 3a, but here the shaded portion of the curve below the line is negative, and therefore must be subtracted from the top or positive half of the curve. The final result, therefore, over the same length of wavetrain will be very much less. The characteristic curve, therefore, of Fig. 3 is not so efficient as that of Fig. 1. From the preceding it will be seen that if the grid volts be set to a value "OL," and the changes produced by a signal lie within the limits "OG" and "OS," then the positive and negative halves of the curve will be equal, and their addition zero, consequently nothing will be heard in the telephones.

Similarly, if a wavetrain be sufficiently damped, a constant high resistance will act as a rectifier, for the areas of the positive and negative halves of the wavetrain are unequal.

In Fig. 4 is shown the characteristic curve of a valve as obtained in practice (anode current plotted against grid volts). From this it will be seen that any increase in grid volts above the value "OS" produces no further change in the anode current. This point is often referred to as the "saturation" point. Rectification can usually be obtained at both top and bottom bends of the curve, but as the change of curvature at the lower bend is, in most valves, greater than that of the upper bend, it is the lower bend which is generally used for rectification purposes. For the most efficient rectification, the grid potential would be set to "OG," and the conditions would then approximate to those shown in Fig. 3.

The law for a rectifying curve such as that shown in Fig. 4 is that the strength signals in the telephones is proportional to the square of the strength of the incoming signals.

If the anode volts are increased, and the filament current kept constant, the curve slides bodily to the left without any change in shape, but if the anode volts are kept constant, and the filament current is varied, the curve stays in the same position, but the saturation point

Fig. 5.

"S" moves up and down, and, as may be expected, when the filament is very dull, is arrived at for a small value of anode current. This property of the valve is a very valuable one, and a little further study will show how, by its use, a jamming station may be eliminated. In Fig. 5 the characteristic curve of a valve is shown with the filament dulled down. The grid potential is set at "OG," and the sine curve represents the incoming signals. The positive half of the curve takes

Fig. 6.

Valve Amplifiers for Shipboard Use

the grid volts to "OM," and consequently the anode current which is its limiting value. If now a much stronger (dotted) comes in at the same time and on the same frequency, although the grid volts are now taken to "OL," there is an increase in the anode current, so that signal voltage "GL" will produce the same strength of signal in the telephones. Such an adjustment would prove a big advantage, as jamming station is reduced to the same strength as the desired signal, then readability is much improved. The matter will be taken a step further.

Reference to Fig. 4 will show, as has already been pointed out, that the change in curvature of the top bend of the curve is not so great as that of the lower bend. For nearly all signals, the straight part of the curve can be found where the curvature of the anode curve are equal, and therefore balance out. However, of different damping and different strengths of signals, the difference in curvature of the upper and lower bends will not all coincide, but will have different curvatures along the straight part of the curve. It is, therefore, possible to read the station one wishes to hear. In view of the fact that the rectification is inefficient, and signals are reduced, an adjustment gives a large area to the negative part of the curve. The reason that magnification after rectification becomes necessary to bring signals up to strength again. Having regard to the law of the rectifier, it will be conceded that the only effective method of increasing the sensitiveness of the rectifier is to magnify the high-frequency current before rectification. It has been explained that the adjustment for the going of jamming necessitates a low-frequency magnification, so the requirements which the amplifier has got to follow are:—

- (1) Magnify before rectification.
- (2) Rectify.
- (3) Magnify after rectification.

HIGH-FREQUENCY MAGNIFICATION.

In Fig. 6 is shown the simplest circuit of the three-electrode valve, and, save for the introduction of the inductance "L" in the anode circuit, is the same as that in Fig. 2. In the case of frequency magnification, the curve of the resulting anode current should be exactly the same shape as the curve of the incoming signal. Such a condition only obtains when the characteristic of the valve is straight over quite wide limits. For most telephony, it does not matter if there is a certain amount of curvature. If the grid potential is adjusted to a value "OG," the current in the anode circuit, which now contains the inductance "L," will be much greater than the current induced by the incoming signal, and will have the same shaped curve and be of the same strength. An arrangement constitutes a one-stage magnifier.

the grid volts to "OM," and consequently the anode current to "OD," which is its limiting value. If now a much stronger signal (shown dotted) comes in at the same time and on the same wavelength, although the grid volts are now taken to "OL," there is no corresponding increase in the anode current, so that signal volts "GM" and "GL" will produce the same strength of signal in the telephones. Such an adjustment would prove a big advantage, because if the jamming station is reduced to the same strength as the signal to be read, then readability is much improved. The matter, however, can be taken a step further.

Reference to Fig. 4 will show, as has already been pointed out, that the change in curvature of the top bend of the curve is not so great as that of the lower bend. For nearly all signals a point on the straight part of the curve can be found where the two halves of the anode curve are equal, and therefore balance out. For signals, however, of different damping and different strength, owing to the difference in curvature of the upper and lower bends, these points, for a balance, will not all coincide, but will have different positions along the straight part of the curve. It is, therefore, often quite possible completely to eliminate the jamming station, and yet still be able to read the station one wishes to hear. In view of the fact that such an adjustment gives a large area to the negative part of the curve, the rectification is inefficient, and signals are reduced. It is for this reason that magnification after rectification becomes necessary in order to bring signals up to strength again. Having regard to the square law of the rectifier, it will be conceded that the only efficient and effective method of increasing the sensitiveness of the receiver is to magnify the high-frequency current before rectification. In the foregoing it has been explained that the adjustment for the elimination of jamming necessitates a low-frequency magnification after rectification, so the requirements which the amplifier has got to fulfil are as follows:—

- (1) Magnify before rectification.
- (2) Rectify.
- (3) Magnify after rectification.

HIGH-FREQUENCY MAGNIFICATION.

In Fig. 6 is shown the simplest circuit of the three-electrode valve, and, save for the introduction of the inductance "L" in the anode circuit, is the same as that in Fig. 2. In the case of ideal high-frequency magnification, the curve of the resulting anode current should be exactly the same shape as the curve of the impressed grid volts. Such a condition only obtains when the characteristic curve of the valve is straight over quite wide limits. For Morse signals, of course, it does not matter if there is a certain amount of distortion; this only becomes troublesome when one is trying to receive wireless telephony. If the grid potential is adjusted to a value "OL" so that the valve is working on the straight part of the characteristic (Fig. 4), the current in the anode circuit, which now contains the inductance "L," will be much greater than the current induced by the signal, and will have the same shaped curve and be of the same frequency. Such an arrangement constitutes a one-stage magnification of the current in

its high-frequency form, and is often referred to as one high-frequency magnification.

Before going further, we must investigate a little more closely what is actually happening in the valve itself. When the filament or cathode is incandescent, electrons are given off, and if the grid be charged positively with regard to the negative end of the filament, the electrons will travel towards the grid along the electrostatic lines of force thus produced. In rising through one volt, the speed gained is 6,000 cms. per second, and in rising through 100 volts, it is 60,000 cms. per second. When a positive potential is applied to the anode of the valve, electrostatic lines of force are created between the anode and the filament which lines pass through the grid, and there will be a constant positive potential drop along them over the space between the grid and filament. The effective grid voltage is the addition of this potential drop to the applied grid volts, having due regard to the sign of these applied grid volts.

Under the influence of its effective potential, therefore, the electrons start to move towards the grid, and the speed with which they arrive at the grid will vary with the variations of the grid potential. As the grid is in the form of a mesh or spiral, the majority of the electrons pass through it, and therefore immediately start travelling towards the plate at which they arrive at a high velocity. The number of electrons which the filament is capable of giving off depends upon the temperature at which it is being run, and that number of them which are attracted towards the grid depends upon the grid voltage. When the grid volts are sufficiently high, all the electrons which the filament can give off, assuming a constant filament temperature, are attracted towards it, pass through it, and arrive at the anode. As there are no more electrons to be attracted, any further increase in grid volts can produce no more anode current, and thus we arrive at the "saturated" condition.

RECTIFICATION.

In Fig. 7 is shown the introduction into the valve of a second grid, and the connections to this grid will be the same as those to the plate in Fig. 6. The fourth or outer electrode, to be known as "outer electrode," is shown connected to the filament. Now in our explanations of Fig. 6 we have shown that the electrons arrive at the plate with a high velocity, and, as in Fig 7, this plate is now in the form of a grid, the electrons will pass through it in the same manner in which they pass through the first grid.

Inasmuch as the outer electrode is at the same potential as the negative end of the filament, the electron, once through the second grid, starts to travel, as it were, uphill, for it is now under the action of a repelling force. As the drop in volts between the outer electrode and the second grid is equal to the rise in volts between the filament and the first grid, the speed of the electron at the outer electrode will be equal to its speed at the filament. For the purpose of this article it will be sufficient to assume that the electrons leave the filament with no initial velocity, and therefore from the preceding, it will be seen that their velocity becomes zero just before they arrive at the outer electrode. If now an alternating EMF be applied between the outer electrode and the negative end of the filament, during the positive half

of the wave, electrons will be attracted to the outer electrode, and during the negative half they will be repelled. Rectified current, therefore, will flow in the outer electrode circuit, and the efficiency of rectification will approximate to that of a crystal. The connections for

Fig. 7.

Fig 8.

the detection of signals with such an arrangement are shown in Fig. 8. The constant voltage applied to the first grid is of quite an arbitrary value, but must be sufficiently positive to enable an adequate current to flow in the second grid circuit.

Thus far we have not utilised the anode current that we have shown would be flowing in the inductance "L" (Fig. 6). If now this inductance is made to constitute the primary winding of a suitable

Fig. 9.

transformer, and the secondary winding of this transformer be inserted in the outer electrode circuit (Fig. 9), then the alternating current in the primary winding will induce an alternating EMF in the secondary winding, so that the outer electrode will be made alternatively positive and negative. We have already shown that the outer electrode circuit thus becomes a rectifier, but whereas in Fig. 8 the volts applied to it were those induced by the signal, in Fig. 9 the applied volts are the signal volts after they have been magnified as explained in Fig. 6.

LOW-FREQUENCY MAGNIFICATION.

The preceding considerations show that in the one valve we have already got one high-frequency magnification, and also rectification, and it now remains to arrange for low-frequency magnification. This can be provided for by coupling back the plate circuit to the first grid

Fig. 10.

circuit. With such an arrangement, the rectified impulses in the outer electrode circuit will be impressed on the first grid, and will therefore produce similar magnified impulses in the circuit of the second grid. As these are already in a rectified form, the telephone transformer can now be transferred to the second grid circuit, and a signal then received

Fig. 11.

will have been magnified in its high-frequency form, rectified and magnified again in its low-frequency form. Fig. 10 shows the diagram of connections of the circuit. "Th" is the high-frequency transformer, and "Tc" is the transformer which provides the coupling between the outer electrode circuit and that of the first grid. "Tc" is an iron core

transformer, the ratio of the windings of which are 1 telephone transformer wound for low-resistance telegraph circuits of the first grid and that of the outer electrode frequency currents flowing in them, the windings of the "Tc" and "Th" in these two circuits, must be shunted in order to provide a low impedance path for these currents.

Fig. 11 shows in diagrammatic form the connections of a 91 amplifier. "Th" is made up of three separate windings connected in series. As in the case of the Type 71, with copper wire. The barrel switch has three positions (1) the transformers "T2" and "T3" are short circuited, "T1" is effective. This arrangement is for short waves, "T1" having been designed to cover wavelengths of 100 to 200 metres. In position (2) transformer "T1" is short circuited and "T2" is in series becoming effective. This arrangement is designed to cover the 600 metre range. In position (3) the transformers are in series, no windings being short circuited. This arrangement will cover most effective wave range that this arrangement will cover most effectively 2,000 metres to 4,000 metres. The potentiometer is in that anti-jamming adjustments, as explained in the first article, may be made. To prevent this adjustment being extra resistance has been put in series with the potentiometer for a given voltage change the slider has to be moved

transformer, the ratio of the windings of which are 1/1. "T_t" is the telephone transformer wound for low-resistance telephones. As the circuits of the first grid and that of the outer electrode have high-frequency currents flowing in them, the windings of the transformers, "T_c" and "T" in these two circuits, must be shunted by a condenser in order to provide a low impedance path for these high-frequency currents.

Fig. 11 shows in diagrammatic form the connections of the Type 91 amplifier. "T_h" is made up of three separate transformers connected in series. As in the case of the Type 71, they are wound with copper wire. The barrel switch has three positions. In position (1) the transformers "T₂" and "T₃" are short circuited, and only "T₁" is effective. This arrangement is for short waves, the transformer "T₁" having been designed to cover wavelengths of the order of 300 metres. In position (2) transformer "T₃" is short circuited, "T₁" and "T₂" in series becoming effective. This arrangement has been designed to cover the 600 metre range. In position (3) all the transformers are in series, no windings being short circuited, and the wave range that this arrangement will cover most efficiently is from 2,000 metres to 4,000 metres. The potentiometer is inserted in order that anti-jamming adjustments, as explained in the first part of this article, may be made. To prevent this adjustment being too critical, an extra resistance has been put in series with the potentiometer, so that for a given voltage change the slider has to be moved further.

VALVE PATENTS FOR 1920

By I. SHOENBERG.

No. 124,721. By H. P. DONLE. (Assigned to Connecticut Telephone and Electric Co.)

The specification describes a new construction of valve, in which both the plate and the controlling electrode are placed outside the bulb containing the filament. In the drawing (see Fig. 1), 5 is a bulb, made of glass, quartz, or like material. The filament, 2, is placed within, while plate, 8, and controlling electrode, 6, are arranged outside the bulb. 6 and 8 "are of suitable conducting material, such as silver or copper, and may be applied to the globe in any suitable way, such as by electro-deposition, or shrunk on in the form of bands, or held on the globe by clamps." The plate, 8, is shown as separated from the controlling electrode, 6, by the insulating space, 7, the edges of which are of a serrated outline. "This increases the area of the two elements, which are opposed to each other." As to the operation of the device, the inventor offers the following explanation:—

"When the filament is lighted by the source of current at A, the globe, which is of glass or other material normally non-conductive to electricity, becomes warmed, and the electrons released from the incandescent filament act as carriers for the energy of the battery, B, from the target to the filament, enabling said battery to force a certain amount of current through the wall of the globe and across the intervening space to the filament. If a charge is now placed upon the electron deflector element, 6, by means of rectified radio oscillations, for instance, this rectification being due to the unilateral conductivity between the filament and electron deflector, the flow of electrons will be aided or retarded as the case may be, depending upon the polarity of the charge, and a very slight charge upon this conducting element, 6, is sufficient to affect the flow of current through the other branch, which includes the receivers, to a large degree. The conducting element, 6, thus acts, in effect, as a deflector, and by its deflection of the electrons to a secondary path serves to affect the receiving circuit, and thus produce a true reproduction of the radio signals. The magnified effects obtained in the receiving circuit enable the detection of very weak signals, and hence make the device more sensitive, enabling the detection of such weak signals as would probably have been 'lost' heretofore. It will be noted that the operation depends upon the electron flow through the warmed glass or other normally non-conducting wall of the globe, and not simply upon the flow through an evacuated space, as heretofore. In other words the efficiency of the device is not dependent solely upon the maintenance of a proper vacuum."

Fig. 1.

No. **130,965**. By H. P. DONLE. (Assigned to Connecticut Telephone and Electric Co.)

The invention relates to a new construction of valves, in which the plate is placed outside the bulb containing the heated filament. In Fig. 2, 5 is a bulb, made of glass or quartz, or the like, containing the filament, 6, heated by battery, A, and the helical grid, 10. The plate, 9, is placed outside the bulb, and is connected to the filament through the telephone, 13, and battery, B. The operation of the device is explained by the inventor as follows:—

Fig. 2.

"The filament when energised by the battery, A, heats up the globe, which, as before stated, is usually made of glass or other material, such as quartz, normally non-conductive at room temperature, but which, when heated to a higher temperature of, say, 100° C. or over, becomes conductive to a certain degree, whereupon current from battery, B, passes from the anode through the heated glass to the layer of electrons on the inner wall of the globe, said current being conducted between this wall and the filament by the electron stream.

"If a charge is now placed upon the controlling member, as by means of radio oscillations, for instance, the flow of current through the glass is decreased by the decreasing in area of the electrons lying upon the inner wall of the globe, the controlling member apparently acting in this case to absorb unto itself a certain number of these electrons."

The specification also contains the following statement:—

"This valve, generally speaking, is independent of the vacuum about the filament; in fact, for many purposes an inert gas may be used, in which case, of course, the conduction would be by means of ions instead of electrons."

No. **134,832**. By SIEMENS and HALSKE AKTIENGESellschaft.

The specification describes a convenient method for impressing a P.D. between the filaments and grids of cascade amplifiers. For this purpose

the heating battery is utilised in the manner shown in Figs. 3 and 4. It will be seen that the filaments are connected in series, and the grid potentials (relatively to the filaments) are obtained either by connecting them to intermediate points of the lighting battery, 5, as in Fig. 3, or by utilising the potential drop along the filaments, as in Fig. 4. For valve 1, however, a special source of potential will be necessary, and this is furnished in Fig. 3 by battery, 7, and in Fig. 4 by the potential drop across resistance, r_1 .

No. 135,792. By W. J. POLYBANK.

The invention relates to the construction of bases for valves, and is illustrated in Figs. 5, 6, and 7, which are described in the specification as follows:—

"Four contact pins, 1, have roughened sides at their base, and are held in a jig while being moulded in the block, 2, formed of insulating material.

Fig. 5.

Fig. 6.

Fig. 7.

The block is formed with wedge-shaped grooves, 3, on its periphery, and after the block is slipped into the shell, 4 (which has previously been fitted to the globe of the valve), the metal of the shell is forced into the grooves by a specially shaped tool, and the holder, 2, is firmly fixed in the shell. The lead wires from the globe pass through the passage, 5, in the block, along the bore, 6, of the pins through the slot, 7, therein, and are secured to the pins by soldering."

No. 136,712. By WESTERN ELECTRIC CO., LTD. (A communication from the Western Electric Co., of America.)

When employing valves of the three-electrode type, with the output and input circuits coupled in any manner whatever, for the purpose of producing oscillations, it is well known that besides the fundamental frequency determined by the elements of the oscillating circuits, higher harmonics are also generated. For several reasons, however, a "pure" wave may be desired and the present invention proposes to filter out the undesirable harmonics in the manner shown on the drawings (Figs. 8 and 9).

Fig. 8.

Fig. 9.

condenser, 36-40. If the capacities of the condensers are properly chosen,

their impedance will be lower for the harmonics than for the fundamental frequency. It follows that the currents due to the harmonics will possess a comparatively larger value and will have a larger extent in the resistance than those due to the fundamental oscillation. The P.D. across the last condenser, 40, will be entirely on the fundamental oscillation. The voltage across the filtered H.F. current flowing in resistance, 47, shunted by a blocking condenser, 27, in order to obviate a short circuit through inductance, 28. The choke coil, 33, prevents the current from circulating in the battery circuit. Another advantage of interaction between the resistances, 41-45, consists in the fact that it is to be borne in mind when choosing the magnitude of the filter is shown in Fig. 9. Here the circuit is tuned to the fundamental oscillation, and will therefore present almost infinite impedance to currents produced by the latter. On the other hand, the currents due to harmonics will be comparatively low and will be consumed in the resistances.

No. 137,098. By L. B. TURNER and R. H. WAGNER.

In the known methods proposed for controlling by the radiated power, the power which has to be spent in the circuits is proportional to the radiated power. The present invention describes an arrangement by means of which the expenditure in controlling can be kept very low even when dealing with powerful oscillations.

As will be seen from Fig. 10, the microphone, 1, is made to vary the anode potential of the generating valve, 3, the output and input circuits of which are coupled by means of coils, 6 and 7. The H.T. supply is shown in the form of a battery, 15. The oscillations produced by valve, 3, are of such amplitude that the control through the voice can be made perfect without any special means (as for instance amplifying the microphone variations). The modulated oscillation is then amplified by valve, 4, the grid circuit of which is coupled through coil, 8, to the plate circuit of valve, 3. The oscillation is transmitted to aerial, 5. In order to obtain a variable gain, a special battery, 10, is inserted between the grid and the valve, 4, and the voltage of this battery is so chosen as to vary the negative permanently or during a considerable portion of the oscillation. Instead of a special battery, a resistance can be employed.

Fig. 10.

No. 137,876. By G. F. PARTRIDGE and B. S. SMITH.

The object of the invention is to apply the resistance coupling in cascade to the amplification of low frequency oscillations. The use of ohmic resistances only in the plate circuits, it is expected, will retain the same "colour" as those which are used in the input terminals. On Fig. 11, K and L are the input terminals, B, R,

impedance will be lower for the harmonics than for the fundamental frequency. It follows that the currents due to the harmonics possess a comparatively larger value and will be dissipated to a larger extent in the resistance than those due to the fundamental oscillation. The P.D. across the last condenser, 40, will depend almost entirely on the fundamental oscillation. The voltage drop due to the filtered H.F. current flowing in resistance, 47, shunting the last condenser, is amplified by tube A, the plate circuit of which contains the tuning condenser, 27, in order to obviate a short circuit of battery, 14, through inductance, 28. The choke coil, 33, prevents the amplified H.F. current from circulating in the battery circuit. Another advantage connected with the employment of the resistances, 41-45, consists in the elimination of interaction between the filtering and oscillating circuits, and this has been borne in mind when choosing the magnitude of those resistances. A modified type of filter is shown in Fig. 9. Here the circuits, 65-67, are tuned to the fundamental oscillation, and will therefore present a path of almost infinite impedance to currents produced by the latter. On the other hand, the currents due to harmonics will be comparatively large and will be consumed in the resistances.

137,098. By L. B. TURNER and R. H. WAGNER.

In the known methods proposed for controlling by the voice the energy radiated from the aerial, the power which has to be spent in the controlling circuits is proportional to the radiated power. The present specification describes an arrangement by means of which the expenditure of energy on controlling can be kept very low even when dealing with powerful radiators.

As will be seen from Fig. 10, the microphone, 1, is made to vary the grid potential of the generating valve, 3, the output and control circuits of which are coupled by means of coils, 6 and 7. The power supply is shown in the form of a battery, 15. The oscillations produced by valve, 3, are of such magnitude that the control through the microphone can be made perfect without any special means (as for instance amplifying the microphone variations). The modulated oscillation is then amplified by valve, 4, the grid circuit of which is tuned through coil, 8, to the plate circuit of valve, 3. The amplified oscillation is transmitted to aerial, 5. In order to obtain a very high amplification, a special battery, 10, is inserted between the grid and filament of valve, 4, and the voltage of this battery is so chosen as to keep the grid positive permanently or during a considerable portion of the period of the oscillation. Instead of a special battery, a resistance shunted by a condenser can be employed.

Fig. 10.

137,876. By G. F. PARTRIDGE and B. S. SMITH.

The object of the invention is to apply the resistance coupling of valves in cascade to the amplification of low frequency oscillations. Owing to the use of ohmic resistances only in the plate circuits, it is expected that the amplified sounds will retain the same "colour" as those which give rise to the initial variations on the grid of the first valve. On Fig. 11, which illustrates the invention, K and L are the input terminals, B, B¹ and B² high resistances

of the same order as the effective resistances of the valves (about 50,000 ohms when using French hard valves). The condensers H H^1 allow of applying the voltage drop across the resistances B and B^1 due to the magnified variation at the input terminals between filament and grids of valves A^1 and A^2 . At the same time they eliminate the danger of having permanently between

Fig. 11.

these grids and filaments a P.D. equal to a considerable fraction of the voltage of the H.T. battery, 5. Condenser H^2 prevents the D.C. from flowing through the telephone M . The resistance E and E_1 (about 200,000 ohms each) serve as leaks between grids and filaments of valves A^1 and A^2 . This is necessary, for otherwise the accumulation of negative electrons on the grids would stop the flow of electronic current through the valves.

No. **138,383**. By M. LATOUR.

The specification describes a device which would give automatically an alarm immediately on the filament of a valve burning out. For this purpose the iron core, 3 (Fig. 12), is provided with two coils, 3, 4, wound in opposite directions. Coil, 4, consists of a few turns of thick wire, while coil, 5, has a

Fig. 12.

large number of turns of fine wire. The ampere-turns on both coils are equal, and no magnetic field is therefore produced as long as current is flowing in both windings. On the filament burning out, the balancing effect due to coil, 4, will disappear, the coil, 3, gets magnetised, and an alarm signal of one kind or another will be given.

Fig. 13.

No. 139,748. By S. DUSHMAN.

The invention relates to an improved construction of valves. As will be seen from the drawings (Figs. 13 and 14), the anode, 4, is of a cylindrical shape, and has for the purpose of better cooling, ribs, 11. The ribs are formed by suitably folding a thin sheet of metal. The method of supporting the anode is perfectly clear from the drawing and needs no further explanation. The grid has the form of a spiral made of comparatively fine and flexible wire, so that the coil could not support itself, and in order to maintain the desirable shape each turn is welded on the stout wires, 9 and 10.

Fig. 14.

No. 139,867. By L. B. TURNER.

The specification describes an arrangement for obtaining retroaction between the grid and plate circuits of a valve. The principle can be easily understood from Fig. 15. If an additional P.D., due to a signal, say, is introduced between 7 and 8, so as to make v_1 larger, for instance, there will flow a larger current in the plate circuit of valve 1, and owing to this the potential drop across resistance, r_1 , will also increase. By paying attention to the sense in which the current flows it will be seen that this will lead to a decrease of v_2 , and therefore to a decrease in the anode current of valve 2. The drop of potential across resistance r_2 , which, taking into account the signs, works against v_1 will decrease, thus resulting in a further increase of the P.D. between the filament and the grid of valve 1. This process will go on until a new state of electrical equilibrium between the two valves is reached. It is clear that a small variation of e will lead to a considerably amplified variation of $V_1 - V_2$ (V_1 and V_2 being the anode potentials). The inventor states that an amplification of 1600 ($e = 0.005v$, $V_1 - V_2 = 8v$) was obtained in a practical case under the following conditions: batteries B_1 and B_2 were about 95 volts each, batteries b_1 , b_2 —each about 4 volts, $R_1 = R_2 = 55,000$ ohms, $r_1 = 9,500$ ohms, $r_2 = 13,600$ ohms.

Fig. 15.

The effect of retroaction can be looked upon as equivalent to the introduction of negative resistance, so that the net resistance of the circuit is determined by the algebraic sum of the positive and negative resistances. The amount of negative resistance for the arrangement shown on Fig. 15 is given by:—

$$a_1 \left[\frac{g_1 g_2 r_1 r_2}{1 + a_2 (r_1 + R_2)} \right] \quad \text{where}$$

a_1 , a_2 , g_1 and g_2 are the conductance parameters of the valves.

It follows that the net resistance of the anode circuit of valve 1 will be:—

$$\frac{1}{a_1} + r_1 + R_1 - \frac{g_1 g_2 r_1 r_2}{a_1 [1 + a_2 (r_1 + R_2)]}$$

Fig. 16.

If an oscillatory circuit, L, C , is inserted in place of R_1 (see Fig. 16), and the constants are so adjusted as to obtain a net negative resistance, the arrangement can be employed for generating oscillations, the frequency of which will depend on the values of L and C .

For further information the reader is referred to the article entitled "The Kallitron, an Aperiodic Negative-Resistance Triode Combination," published in the *Radio Review* for April, 1920, p. 317.

No. 140,166. By the BRITISH THOMSON-HOUSTON CO., LTD. (Communicated by G.E.C. of America.)

The invention relates to a method of supporting the anode of a valve.

Fig. 17.

In a rectangular sheet of metal, 11 (Fig. 19), the strips, 12 and 13, are partly cut away, as shown in the drawing. The sheet is then bent into a cylinder, and the strips are arranged to extend in opposite directions (Fig. 18). The ends of the strips are wound round the specially provided arms, 8, 9 (Fig. 17), and welded to them. In this manner firm support for the anode is obtained.

No. 140,538. By C. S. FRANKLIN.

It is well known that directional effects can be obtained by means of suitably spaced aerials. In such systems, however, it is important to control the phase difference between the oscillations as well as their intensities, for these two factors will determine the shape of the characteristic curve of radiation. This control can be obtained in a comparatively convenient manner by feeding both aerials from a common source of H.F. currents. For considerable wavelengths this arrangement involves, however, long leads, and therefore heavy losses. The present invention eliminates this difficulty by employing a central source of very small power, and amplifying the weak currents by means of three-electrode valves, say, placed in the immediate vicinity of the aerials. The invention is illustrated by Fig. 20, which is explained by the inventor as follows:—

"The oscillations in the two aerials are generated by valves, V^1, V^2 , respectively, the power being supplied by a dynamo, D , and conveyed to each valve by wires, P^1, P^2 . This is, however, a matter of convenience, as, if desired, each valve may have its own independent source of power."

" CV is a control valve of relatively smaller power and situated at some convenient place, preferably equidistant from the two aerials. This control valve is arranged to generate oscillations of the desired frequency."

"A coil, M , in the anode circuit of the control valve is coupled to coils, N^1 , N^2 , connected through tuning condensers, F^1 , F^2 , to lines, L^1 , L^2 , which convey the oscillations from the control valve to transformers, T^1 , T^2 , the secondaries of which are connected to the grids of the valves, V^1 , V^2 , and control the frequency and phase of the oscillations generated by them."

"The frequency is determined by the valve, CV , and the phases by the tuning of the circuits comprising the primaries of the transformers, T^1 , T^2 , the lines, L^1 , L^2 , the condensers, F^1 , F^2 , and the coils, N^1 , N^2 , respectively. The phases may also be controlled by the tuning of the aerials, A^1 , A^2 ."

"It is necessary to arrange the twin leads of L^1 and L^2 so that the waves radiated by A^1 and A^2 affect them equally and produce no reaction effect on the valves, V^1 , V^2 , or CV ."

Fig. 20.

No. 141,900. By R. WHIDDINGTON.

It is well known that the grid and plate circuits of a valve can be so adjusted that the valve will be on the "threshold" of oscillation, and on the slightest disturbance taking place the oscillations will set in. The above adjustment gives the possibility of bringing about powerful oscillating currents, even by means of very weak signals. It is, however, necessary that the oscillation should be quenched out in order to bring the apparatus back to its quiescent state, and the present invention proposes to attain this object by means of the arrangement shown on Fig. 21.

Fig. 21.

of coils, 3, 5, is so adjusted that the slightest increase in the mutual inductance will be sufficient to cause the small incandescent lamp, 7, in the plate circuit to glow, owing to the oscillations which will set in. Upon a small potential disturbance being applied between grid and filament the lamp will therefore begin to glow, and the resistance of the plate circuit will increase. This will result in the inhibition of the oscillation immediately on the ceasing of the disturbance.

No. 142,207. By THE BRITISH THOMSON-HOUSTON CO., LTD. (Communicated by G.E.C. of America.)

The invention relates to the construction of grids for thermionic valves, and has for its object to maintain the spacing between the wires, which form the grid constant. As will be seen from Fig. 22 "the grid is made up of a large number of turns of fine wire wound around the framework, 11, as indicated. Upon each side of this framework over which the grid wire passes we provide closely coiled spirals of fine wire, 20, as indicated. Each turn of the grid wire slips between two adjacent turns of this spiral, and one or more turns of the spiral are interposed between adjacent turns. It will be apparent

Fig. 22.

that with this construction even though the grid wire may expand so as to become somewhat loose upon the framework, 11, adjacent turns of the grid wire cannot come in contact with one another and hence the desired spacing of the turns will always be maintained."

No. 142,333. By L. B. TURNER.

Where electromagnetic relays are used in connection with amplifying valves there is always a certain deflecting power existing, even in the absence of the signal to be received. This is due to the normal anode current. Such a pre-existing effect, however, tends to diminish the sensitiveness of the relay, and the present specification describes a method for removing this difficulty. As will be seen from the drawing (Fig. 23), a perfectly symmetrical arrangement of two valves, T_1 and T_2 , is employed. One coil, W_1 , of the relay is inserted in the plate circuit of T_1 , while the other coil, W_2 , is inserted in the plate circuit of T_2 . The windings are so arranged that in the absence of a signal on line, L_1 L_2 , *i.e.*, when there is no P.D. between L_1 L_2 , there is no deflecting effect on the tongue of the relay. On the arrival of a signal there will be a potential drop across the resistance R , and while grid G_1 will become more positive, say, grid G_2 will become more negative with the result that the current in W_1 will increase, while the current in W_2 will decrease. The balance which existed before will be upset and the tongue of the relay will be deflected to the left or the right, according to the relative signs of L_1 L_2 .

Fig. 23.

No. **142,571**. By **WESTERN ELECTRIC CO., LTD.** (Communication from the Western Electric Co. of America.)

In order to obtain several frequencies from one source of A.C., use may be made of the upper harmonics which appear when the form of the fundamental wave is distorted. According to the present invention the distortion is obtained by working on the saturated portion of the characteristic of a valve. One method of application is shown on Fig. 24. The source of A.C., 20, is coupled to circuit, 21-23, tuned to the frequency of 20 and connected between grid and filament of the valve, 22. The maximum voltage applied to grid, 22, is in excess of that required for obtaining the saturation current in the plate circuit. Owing to this, the wave produced in line, 26, which is coupled to the plate circuit by means of transformer, 25, will possess a form more or less like a trapezoid. Such a wave, as it is well known, can be analysed into

several components, the frequencies of which will be multiples of the fundamental frequency. In order to separate the several harmonics, the line,

Fig. 24.

Fig. 25.

26, is bridged by the composite conductors, F, F^1, F^2, F^3 , etc., each of which consists of an inductance and capacity. The latter are so proportioned that F, F^1, F^2, F^3 , are in tune with the frequencies of the fundamental wave first, second, third, etc., harmonics respectively. Each frequency is then passed on to lines 32, 38, 33, etc., with or without amplification. If a very pure harmonic is desired, a filter, 31, as shown in line, 32, may be employed.

Instead of a three-electrode valve, an ordinary Fleming rectifier may be used. The suppression of alternate half-cycles will lead to further distortion in addition to the effect obtained through saturation. This method is shown on Fig. 25, where the current with fundamental frequency is rectified by the valve, 36, containing only two electrodes. The circuits, A^1, A^2, A^3, A^4 , are tuned to the frequencies of the harmonics. From the method of connections it is clear that circuit A^1 , for instance, which is tuned to the frequency of the first harmonic will present a very high impedance to currents of this frequency. It follows that the voltage impressed on the grid of the amplifying valve inserted in A^1 , will be determined almost exclusively by the first harmonic.

No. 144,803. By BRITISH THOMSON-HOUSTON Co., LTD. (Communicated by G. E. Co. of America.)

It has been proposed before, for the purpose of modulation, to shunt an inductance inserted in the aerial with the filament-plate path of a valve. By impressing the voltage variations caused by the voice acting on the microphone between the grid and filament of the valve, the resistance between the filament and plate, and therefore the amount of energy diverted from the aerial, is made to vary in sympathy with the voice. The present specification describes an arrangement for modulation carried out on the above lines, but somewhat modified in order to meet certain practical requirements.

On the drawing (Fig. 26) the antenna is coupled to the H.F. generator, 2, and the closed circuit, 5-6-7-7-8, tuned to the frequency of, 2. By properly adjusting the transformer, 4-5-8, a high voltage can be made to build up across condensers, 7, 7, and the amount of energy required for maintaining this voltage will be very small. To the external terminals of the condensers are connected the plates, 9 and 10, of valve 11, the grid of which is connected to the secondary of the microphone transformer, 17. The filament, 12, and the junction between the condensers, 7, are both earthed, so that the alternative plate circuits, 14-7-10-12-15 and 14-7-9-12-15, are obtained. When the

microphone is spoken into, H.F. energy will be absorbed by the first circuit during the half-cycle when 10 is positive, and by the second circuit during the next half-cycle. It will be seen that in this manner energy will be diverted from the antenna in accordance with the voice. The special advantages of the described arrangement are pointed out in the specification as follows:—

"Our invention is especially suitable when the inductance necessary for tuning the antenna is but a small part of the total inductance. In such

Fig. 26.

a case the inductance, 4, may be made much larger than is necessary for tuning, but this inductance will in effect be neutralised by the condensers, 7, and the final effect so far as varying the effective resistance of the antenna is concerned will be the same as though the inductance, 6, of the oscillation transformer were connected directly in series with the antenna."

No. 146,610. By P. P. ECKERSLEY.

In wireless telephony with valve generators, modulation by the voice is very often effected by varying the anode potential. In the case of the

Fig. 27.

circuits being so arranged that generation takes place only when the microphone is energised, this method of modulation leads to distorted speech, owing to the fact that there is a time lag between the application of a P.D. between the plate and filament and the appearance of H.F. oscillations. The present specification describes a method of obviating this drawback. The left-hand valve shown on Fig. 27 is made to generate oscillations of the desired frequency and of comparatively small amplitude, and its output circuit, L_1, C_1 , is coupled to the grid circuit of the power valve by means of the transformer, L_1, L_2 . It is obvious that as long as no potential is applied to the plate of the power valve the antenna does not radiate. As soon, however, as the microphone is energised, the necessary H.T., varying in sympathy with the voice (microphone—amplifier—transformer—condenser, C_2), will be applied between the plate and filament,

and modulated H.F. current will appear in the aerial without any lag, owing to the permanently existing variation of potential on the grid of the power-valve.

No. 147,252. By B. HESKETH.

If a valve is provided with two controlling electrodes (which may be in the form of grids or plates), so arranged that a P.D. applied between them creates an electric field, either transverse, or possessing a component which is transverse, to the electric field due to the P.D. between plate and filament, the functional relationship between the P.D. applied between the controlling electrodes and the plate current is given by Fig. 29. Such a valve lends itself to various applications. Fig. 30 shows how the four-electrode valve can be employed as a detector. It is obvious from the curve on Fig. 29 that the variations of P.D. between *c* and *d*, due to the received signals, will lead to a decrease of the current of the plate, *e*, no matter whether *c* is positive, and

Fig. 28.

Oscillation impressed by A.

- i_1 Plate current when no P.D. is applied between C.D.
- i_2 Value of plate current at any moment when oscillations from source A are impressed between C.D.

Fig. 30.

Fig. 31.

Fig. 32.

d negative, or vice versa. The high resistance, *R*, is introduced in order that the accumulation of charges on *c* and *d* should leak away. The circuit shown on Fig. 31 illustrates the use of the valve as an amplifier. As will be noticed, the battery, *M*, will maintain a permanent P.D. between *c* and *d*. By properly adjusting the voltage of *M*, the oscillations impressed through transformer, *PS*, will be magnified and reduced substantially without distortion in the output circuit, *P*₂, *S*₂. The valve can also be employed for doubling the frequency. For this purpose the oscillations from a source, *A* (see Fig. 32), are impressed between *c* and *d*. As will be seen from Fig. 28, which is drawn with the assistance of the characteristic on Fig. 29, the frequency of the current in secondary, *S*, of transformer, *PS*, will be doubled.

No. 147,320. By N. LEA and J. REE.

When employing the valve as a generator of H.F. oscillations for transmission, it is desirable to place the key in such a manner as to make or break the H.T. supply to the anode, for with the well-known method of inserting the key in the leak, shunting the grid condenser, periodic trains of oscillations are induced in the antenna, even when the key is raised. On the other hand, if the key is to interrupt the H.T. supply, steps must be taken to eliminate sparking. With the position of the key adopted in the present specification (see Fig. 33), the potential drop between its contacts (on being raised) is impressed between grid and filament, and in such a manner that the grid becomes highly negative. This, of course, causes the H.T. supply current to decrease as soon as the contacts are separated even by a very small distance. No heavy sparking can, therefore, take place.

Fig. 33.

No. 148,582. By W. H. ECCLES and F. W. JORDAN.

The invention relates to a method of utilising three-electrode valves for obtaining relay effects. In the arrangement shown on Fig. 34 two valves are combined in such a manner that the grid filament of one is shunted by a comparatively large resistance (R_1 and R_2), which forms a part of the plate circuit of the other. Suppose that by means of a transformer, p , s , a small, say, positive potential is impressed on grid, g_1 . This will lead to an increase in the plate current, and therefore to an increase in the potential fall across resistance, R_1 . As the battery voltage is constant, an increase in the P.D.

Fig. 34.

between the terminal of R_1 must be accompanied by a decrease in the plate potential of the first valve. Owing to this the grid of the second valve which is connected to the plate of the first, will become less positive, and the plate current of the second valve will decrease. Owing to the decrease in the potential fall across R_2 , the plate potential of the second valve will increase, and the grid of the first valve will become more positive, the plate current being further increased. This process will continue and, provided the resistances and valve constants have been suitably chosen, will result in the anode current of the first valve reaching the highest value possible for the given anode voltage and filament current. On the other hand, the anode current of the second valve will fall to the smallest possible value. An instrument, I , inserted in the plate circuit of one of the valves will therefore, give an indication.

In order to restore the arrangement to the initial condition it will be

necessary to interrupt, the operation of one of the valves, as, for instance, by dulling its filament.

On the other hand, it is possible to choose the resistances and valve constants in such a manner that the changes described above will persist only as long as the disturbance applied to the grid of the first valve continues. On the cessation of that disturbance the electrical magnitudes will assume their initial values.

No. **148,632**. By H. J. ROUND.

In wireless telephony it is important that the H.F. oscillations, which are used in the transmission of speech, should not be produced when the microphone is not spoken into, otherwise a special device becomes necessary for switching over from transmission to reception, and *vice versa*. According to the present invention,

such a transmitter, "quiescent" during the intervals of silence, is obtained in the following manner: The microphone, M (Fig. 35), is connected in series with the battery, B, and the primary windings of transformers, T_1 and T_2 . The secondary of transformer, T_1 , is connected through a rectifier, R, to the terminals of condenser, C, on the one hand, and to the plate and filament of the generating valve on the other.

Fig. 35.

It will be seen that when the microphone is spoken into, a part of the energy is utilised for creating, by means of transformer, T_1 , and rectifier, R, a D.C. high-tension potential difference between plate and filament of valve, V, which starts generating H.F. oscillations of a period determined by the antenna, A. At the same time voltage variations in sympathy with the voice are impressed on the anode through transformer, T_2 . The antenna will thus radiate modulated oscillations. During the periods of silence, however, as there is no source of supply in the plate circuit of the valve, no oscillations will be generated.

No. **149,018**. By W. H. ECCLES and F. W. JORDAN.

It is well known that with the ordinary so-called "reaction" arrangement of the plate and grid circuits of a three-electrode valve, the oscillations obtained are not symmetrical. This is specially the case when the coupling is close, for the grid voltage becomes then so high that the representative point is carried to the "saturation" branch of the characteristic. Owing to this, harmonics are produced which cause the lack in symmetry of the oscillations referred to above.

Fig. 36.

Fig. 37.

More perfect oscillations can be obtained by the use of a pair of valves in parallel in the manner indicated on Fig. 36. Here the oscillating circuit LC is so arranged that an increase in the anode current of one valve imparts to this circuit an impulse in a direction opposite to that which results from the increase in the anode current of the other valve. It follows that while one valve stimulates the oscillating circuit during one half-cycle, the other valve acts in the same way during the second half-cycle.

Fig. 37 shows the same arrangement, LC being, however, coupled inductively to the plate circuits.

In both figures R denotes a large resistance, which serves as a grid leak. It is obvious that the oscillating circuit may be placed between the grids of the valves instead of between the anodes.

No. 149,076. By S. R. MULLARD.

The invention relates to the construction of high-power valves, and is illustrated on Figs. 38 and 39, which are explained as follows:—

"The bulb, 1, consists of a cylinder of fused silica, and the filament, 2, preferably made of tungsten is mounted in its longitudinal axis. The tubular seals, 3, by which the

Fig. 38.

filament is mounted at each end, are made long and narrow to allow for breaking off and resealing after the burnt-out filament has been replaced. The inner tubes, 3, in which the filament leads are sealed are secured by being fused to the outer end of the outer tubes, 3."

"The grid, 4, consists of a wire wound spirally and secured upon three wires, 5, 6, 7,

Fig. 39.

mounted at each end, within and by silica sleeves, 8, each having an open mouth or end, 9, and a constriction, 10. The silica sleeves, 8, are fused at equidistant positions around the face of a silica ring, 11, which is provided with three equal radial silica extensions, 12, which touch, and are used to the inner wall of the bulb at 13."

"The anode, 14, consists of a metal cylinder preferably made of tungsten or molybdenum, and is provided with three equidistant metal wires or rods, 17, projecting at each end. The free ends of these wires or rods are sealed within silica sleeves, 18, similar to the sleeves, 8, used for mounting the grid wires. These sleeves have

sealed ends which coincide with the extremities, 13, of the 12, of the grid mounting ring, 11, and are fused with these inner wall of the bulb, at 13."

"It will be seen that the concentricity of the various electrical connections from the grid and anode are brought out by seals, 19 and 20."

"In a modification, the grid supporting ring extensions, 1, 18, may be fused together prior to insertion into and fusion of molybdenum or tungsten wire loop, 21, secured to a tungsten wire, 22, extending between the inner tubes of the filament. Expansion coils, 23 and 24, in the main supporting wire, 22, and the filament leads, 25, wire or filament in tension. The wire, 22, may be secured by and secured by lacing, 27."

No. 149,422. By J. A. FLEMING.

The specification describes a new type of a thermionic construction of which is shown on Fig. 40. The highly evacuated bulb contains the filament, B, which can be made incandescent by a

Fig. 40.

and four electrodes, C, C, D, D, in the form of segments of a cylinder to obviate the possibility of the filament touching one of the spring, H, is employed which will prevent the filament from when its temperature is raised. The application of the new detection of wireless signals is shown on Fig. 41, which is explained as follows:—

"The incidence of the waves on the aerial will produce a potential between the two plates, D, and this will produce a current through a current responsive device, F, such as a telephone magnet receiver of which the coil is connected to the collecting plates, C, and the positive end of the filament, or the receiver to the plates, C, C, by means of a transformer, decrease in the thermionic current due to the incidence of cause a sound to be heard in the telephone."

Fig. 41.

sealed ends which coincide with the extremities, 13, of the radial extensions, 12, of the grid mounting ring, 11, and are fused with these extensions to the inner wall of the bulb, at 13."

"It will be seen that the concentricity of the various electrodes is ensured. The connections from the grid and anode are brought out through the usual seals, 19 and 20."

"In a modification, the grid supporting ring extensions, 12, and the sleeves, 18, may be fused together prior to insertion into and fusion to the bulb, 1."

"The filament may be supported intermediate of its ends by a molybdenum or tungsten wire loop, 21, secured to a molybdenum or tungsten wire, 22, extending between the inner tubes of the seals, 3, to prevent sagging of the filament. Expansion coils, 23 and 24, may be inserted in the main supporting wire, 22, and the filament leads, 25, to maintain the wire or filament in tension. The wire, 22, may be secured between horns, 26, and secured by lacing, 27."

No. 149,422. By J. A. FLEMING.

The specification describes a new type of a thermionic valve, the construction of which is shown on Fig. 40. The highly evacuated bulb, A, contains the filament, B, which can be made incandescent by a source of current

Fig. 40.

Fig. 41.

and four electrodes, C,C,D,D, in the form of segments of a cylinder. In order to obviate the possibility of the filament touching one of the electrodes a spring, H, is employed which will prevent the filament from becoming slack when its temperature is raised. The application of the new valves to the detection of wireless signals is shown on Fig. 41, which is explained by the inventor as follows:—

"The incidence of the waves on the aerial will produce a difference of potential between the two plates, D, and this will cause the thermionic current through a current responsive device, F, such as a galvanometer to diminish. This device, F, may be a galvanometer, but preferably I employ a telephone magneto receiver of which the coil is connected directly between the collecting plates, C, and the positive end of the filament, or I may couple the receiver to the plates, C,C, by means of a transformer. The sudden decrease in the thermionic current due to the incidence of the waves will cause a sound to be heard in the telephone."

her applications, as for instance to alternating current measurements. makes the following statement:—
 "The thermionic instrument responds but also to direct or unidirectional potential plates, D,D, and that such low effect a reduction in the thermionic C,C, from the filament."

ascade for amplifying H.F. currents the highest degree of amplification in other wavelengths, even differing only little from the one favoured by the system, the amplification is considerably smaller. This is very inconvenient in practice where the same amplifier has to be used for the reception of signals transmitted on widely varying wavelengths.

According to the present invention this drawback is removed by using for the windings of the intervalve transformers a wire possessing a high specific resistance. As shown on the drawing (Fig. 42) the secondaries and primaries (P¹S¹, P²S², etc.) may be connected in series. The best results, the windings should be connected in series to capacity is the greatest possible. The transformers are illustrated on Fig. 43, being wavelengths and the ordinates stages obtained at the ends of the series, the primary of which is connected

No. 149,466. By THE BRITISH THOMSON-HOUSTON Co. (Communicated by G.E.C. of America.)

A well-known method of modulating the H.F. oscillations in sympathy with the voice consists in the so-called "anode control," as illustrated in Fig. 44. Here the voltage variations caused by microphone, 14, are first amplified by valve, 16, and then impressed between plate and filament of the generating valve, 2, coupled to antenna, 1. It is obvious from the connections that generation of H.F. oscillations will take place only during that half-period of the L.F. variations when plate, 4, is made positive. During the other half-period no oscillations at all will be produced. This results in a somewhat defective articulation, and the present invention has for its object to remove this drawback in the manner indicated on Fig. 45. Here the intermediate amplifier is omitted, and two generating valves, 19 and 20, are employed. The inductance coil, 8, is common to the plate circuits of both, while separate coils, 21 and 22, are employed for each grid circuit. It will be seen that owing to the fact of the valves being in opposition, oscillations will be produced during both half-cycles of the

Fig. 44.

Fig. 45.

L.F. variation, for at the moment when the plate of valve, 19, is negative, that of valve, 20, is positive and *vice versa*.

No. 149,702. By W. H. ECCLES and F. W. JORDAN.

The amplifiers involving the use of thermionic valves, give best results either for one particular wavelength or for a comparatively narrow band of waves. It follows that amplifiers designed for high frequency oscillations

Fig. 46.

cannot be used efficiently in a direct manner for the magnification of currents of considerably lower frequency. According to the present invention this difficulty can be eliminated by employing the H.F. currents for which the

RR

mediate link. The low frequency currents impressed on the H.F. oscillations in order to be amplified currents are then rectified and re separated in some other manner. It is employed essentially the same as in wireless telephony. The wave is not used for transmission, but for reception. One method of carrying out the above is explained by the inventors as follows:

Each of the three-electrode tube, 1, generates an oscillatory circuit, 2, the voltage applied to the filament battery. Speech currents are carried by means of the transformer, 3, and the output from terminals, A¹, A², to an amplifier in use."

BRITISH PATENT SPECIFICATIONS PUBLISHED DURING 1920

Specification No.	Date of Application.	No. of Application.	Name of Inventor.	Subject-matter.

WIRELESS TELEPHONY AS APPLIED TO COMMERCIAL AVIATION

BY LIEUT. COL. H. B. T. CHILDS, A.F.R.Ae.S., A.M.I.E.E.

THE last edition of the "Year Book of Wireless Telegraphy and Telephony" contained two articles, one a very interesting account of the progress made in the application of wireless to aircraft from the early days of 1914 until the close of hostilities in 1918, contributed by Major Orme. The second article, by Major Prince, gave a lucid description of the application of wireless telephony to aircraft and its use during the war and during the period of the armistice when the wireless telephone was employed on the Folkestone-Cologne Aerial Postal Route.

In the following article it is proposed to deal with the general uses to which wireless may be put for the purpose of assisting the progress of commercial aviation.

It has been accepted as a foregone conclusion that the progress of aviation generally, particularly on organised aerial routes, goes hand in hand with the progress made in the perfecting and organising of wireless systems.

The success and efficiency of any organised aerial service depends to-day, and will depend more and more as time goes on, on a rapid and efficient means of communication both between terminal and intermediate air ports, and also between aeroplanes in flight and with ground stations situated at these air ports.

Before coming to the question of communications it is obviously necessary, in the first place, to have a very thorough meteorological service, including meteorological officers and their equipment at all terminal and intermediate air ports.

The observations recorded at each air port have to be circulated so that meteorological information recorded at various hours during the day is available at all points along the route. This is particularly essential in parts of the world where climatic conditions are liable to change from hour to hour.

To illustrate this let us assume that a service of machines is running between two points separated by a distance of 1,000 miles. Between these two terminal air ports are situated three intermediate air ports. Let us call the terminal air ports A and B, and the intermediate air ports C, D, and E. At certain hours during the day it will be necessary for A, B, C, D, or E to know exactly what the weather conditions are at any of the other stations. Machines employed on this route would presumably fly in relays, each machine doing a distance of 250 miles—goods and passengers being transhipped to another machine which would take them on to the next air port.

Very possibly, in the case of the larger machines with a capacity for carrying larger fuel supplies, the total distance would be traversed with only one relay; that is to say, each machine would skip one of the intermediate air ports, transferring its passengers and baggage at the half-way mark. In these days where large machines of this nature are capable of travelling from 100 to 110 miles per hour, the normal time for traversing this distance of roughly 500 miles would be of the order of four to five hours. The pilot's decision in every case as to whether it was deemed advisable or not to pass the intermediate air port without alighting would rest on weather reports

obtained from air ports ahead of him, or from other machines in flight. The decision arrived at would be a vital one where the country situated between the air ports was unsuitable for forced landings, or where the country was unpopulated and a forced landing might mean a delay of days before assistance could arrive, or might even lead to worse disaster attended by possible loss of life.

All this points to the fact that unless such a route has facilities for rapidly passing weather reports from one air port to the next, and further, for passing this information from the air ports to the aeroplanes in flight, the difficulties in conducting a safe and efficient service would be greatly increased.

It should be sufficiently clear therefore to the reader that the progress of long commercial flights goes hand in hand with the progress and development of communications.

It may, perhaps, be of interest to set forth a few suggestions as to how such a route might be organised, and later to give a few details of the apparatus which is at the present day available for carrying out such an organisation.

Returning to the fictitious route from A to B, with intermediate air ports at C, D, and E, it is assumed that a meteorological service has been organised, and that meteorological officers and apparatus are available at all these points. Weather reports and observations would be taken at certain fixed hours during the day and night, and such observations having been taken it is next the duty of the radio installations at the various ports to pass this information rapidly so that A, B, C, D, and E each know the others weather at certain definite times.

Past experience has gone a long way to show that wireless telephony gives the most rapid and simple means for the transmission of short messages that it is possible to get. It is thought that provided a short, concise, and easily pronounceable code is available this method is by far the quickest. A long figure code can possibly be passed more correctly by the use of the wireless telegraph and Morse Code, but quite certainly not so rapidly as using the wireless telephone. On the other hand, these types of code messages sent by wireless telephony are often received inaccurately, or with difficulty. It would appear, therefore, that the most accurate method of passing such information would be by means of the telephone, with a code which is good phonetically, and as short as possible. In any case, where the wireless telephone is employed it is advisable that all operators at ground stations should be possessed of a knowledge of shorthand.

From these observations it will be seen that the first step to be taken in organising communications is to instal radio-telephony apparatus at all five air ports.

These installations should be sufficiently powerful to be able, if necessary, to jump an intermediate station; that is to say A can communicate with D, skipping C. By this means all five stations can be in possession of each others weather conditions in not longer than half-an-hour after the meteorological observations have been taken and coded.

In countries where climatic conditions are rapidly changing it would, in all probability, be necessary to interchange these reports once every two hours or even less. Where the conditions are more stable, however, interchange every four or six hours would probably be quite

sufficient. In every case it is most essential that this interchange should be as infrequent as possible in order that the system may devote the maximum amount of time in standing-by for calls from aeroplanes in flight. Apart from the sending of weather reports it must be remembered that there will be a certain amount of traffic in the reporting of arrivals and departures of machines, details of forced landings, etc., etc.

The general organisation should be such that the ground station should be available for the reception and transmission of air traffic for at least 75 per cent. of every 24 hours.

From the foregoing remarks it will be seen that telephony is favoured, as opposed to telegraphy.

Returning to the question of the system to be employed from the air, past experience goes to show that here also the wireless telephone is by far the most simple and rapid method of communication.

It would appear from the general trend of opinion, as expressed by the various aircraft transport companies at present operating on the London-Paris, Brussels, and Amsterdam routes that simplicity is a very important factor for the aircraft telephone and telegraph set.

In these early days of aerial transport where every consideration has to be given to the saving of expense wherever possible, it has been considered that, if at all feasible, the air operator should be dispensed with, the chief reason being that where an air operator is carried a seat is taken up that would otherwise be occupied by a passenger or an equivalent weight of merchandise.

In view of these considerations it at once becomes apparent that the air telephone must be extremely easy to handle and capable of giving first-rate results under all conditions at the hands of non-technical personnel.

In the case of the small passenger-carrying machines these sets would have to be operated by the pilots, or in the case of the larger machines, which normally carry a mechanic as well as a pilot, the set would be operated by either the mechanic or pilot.

These points have been very carefully thought out in the design of the latest sets. It must be quite pleasing to the designers of this apparatus to know that a number of machines are now running on the London-Paris route, operated both by pilots and mechanics with complete success.

Allowance should also be made for operating these sets on the ground in the case of forced landings, so that a machine can get in touch with the nearest air-port in order that assistance may be sent out in the shortest possible time.

To comply with International Regulations these air sets have to be available for working on the standard 600-metre ship wave, as well as the wave set aside for air communications, viz. : 900 metres.

Facilities should further be included for working the 600-metre wave on ordinary Morse telegraphy for use in cases where an air operator is carried, or where a pilot or mechanic has a knowledge of the Morse Code.

The 600-metre wave allows for communication from the air to coast stations in cases of distress while over the water. Where the air sets are operated by personnel unacquainted with the Morse Code the telephone can be employed over limited distances, using crystal receivers on the ground.

Before passing on to a description of the installations at the air ports and in the aeroplanes, a few words regarding direction finding for aircraft may not be out of place.

Two methods of direction finding for aircraft have been employed up to date, viz. : where direction finding apparatus is installed on the ground, and, secondly, where it is carried on the aeroplane.

A certain amount of discussion has taken place as to which method is preferable, and as a matter of fact there are many pros and cons for each system. During war-time there is no doubt it is far better to carry the apparatus on the machine, by which means the navigator can employ his wireless compass, using ordinary long or short-distance ground stations for taking his bearings, there being no need for the machine to give its position away by doing any transmission. This method therefore is a secret one and does not give any information to the enemy. Under peace conditions, however, especially in the case of smaller craft, the question of the extra weight entailed does not favour the adoption of this method. The alternative system, where the apparatus is installed at the air-port stations, necessitates the aeroplane calling up the ground stations and asking for its position. Its bearings are taken by two adjacent ground stations, a "fix" worked out, and the information transmitted from the ground to the air. At first sight this method might seem a long and tedious one, but after some practice a position can be asked for and the information received in the air in the course of a minute or two. It would, therefore, seem that the following are the chief points for and against each method :—

1. *Direction Finding on Aircraft Stations.*

Advantages: (a) Secrecy; (b) Responsibility for correct position rests with the navigator on the machine.

Disadvantages: (a) Extra training and work for navigator; (b) Extra weight in carrying apparatus and navigator.

2. *Position Finding at Ground Stations.*

Advantages: (a) Saving of weight of apparatus and operator or navigator on the machine; (b) No extra personnel, or training for same required; (c) Greater accuracy due to absence of noise, magneto disturbances, etc.

Disadvantages: (a) The pilot of the machine has to rely on "fixes" given him by the ground stations; (b) Slight delay between the time of asking for position and the time it is received from the ground stations.

The writer is of the opinion that although much stress has been laid on the necessity of rapid communications between air-ports and aeroplanes in flight, the aid to navigation rendered by direction finders is no less important.

Given an organisation as briefly outlined above, with telephonic communication between adjacent air-ports and between air-ports and aeroplanes in flight, and a complete system of direction finding stations on the ground, with skilled pilots, it should be quite possible to run a successful service over long distances at any season of the year under almost any conditions of weather.

Up to the present the question of daylight flying only has been in the writer's mind. The same conditions, however, apply to night

flying, where, naturally, a complete system of light-houses and landing lights must be added.

The present London-Paris service is gradually being organised on these lines, and as soon as the wireless services on both sides of the Channel and light-house systems are complete, there should be no reason why this service should not be continuous throughout the year. The same would apply to any other route of greater length organised in like manner.

Air-Port Ground Installation.

From the foregoing remarks it will be seen that the functions of an air-port ground station are threefold: Firstly, it provides a link between aircraft in flight and the terminal and intermediate aerodromes, and from thence, *via* the land telephone network, to any desired centre; secondly, it can communicate with other aerodromes on an aerial route, thus reporting arrivals and departures, details of weather, etc.; thirdly, it is equipped with direction finding apparatus, which enables any machine to be immediately located, this location being reported direct to the pilot concerned.

Out of the two alternatives, direction finding in the machine or position finding on the ground, the needs of the present day are best fulfilled by the latter.

The ground station position finder works under far more favourable conditions, *e.g.*, better amplification, freedom from magneto noise, quietness and ease of operating, thus giving a higher degree of accuracy.

The continuous watch which should be kept on a machine flying over a route with these stations becomes a constant check of its position, so that, in emergency, the most fleeting S.O.S. is sufficient to indicate the exact location where the machine is in distress.

These considerations entail certain general conditions of design. In the first place, wireless telephony must be used for simplicity's sake, and, further, in order that a passenger in flight may speak to his business office or home arrangement must be made for the wireless energy received at the ground station to be relayed on to the ordinary local land lines. In the second place, direction finding apparatus must be installed. The direction finding aerials being unsuitable for transmission, a separate transmitting aerial must be used. In order that the accuracy of the direction finding aerials shall not be impaired, the receiving station must be placed some distance from the transmitting aerials. In order that the whole station may be under the control of one operator, some form of Remote Control must be devised so that the transmitter can be completely controlled from the receiving hut. With these objects in view, arrangements are made for combining into one the direction finding and ordinary reception of signals. This necessary arrangement brings with it other advantages, such as freedom from noise, both electrical and mechanical, while receiving, the possibility of quick exchange of messages since the running machinery need not be shut down for every received message, and neatness of arrangement of control switches, the operating board consisting of small current relay switches such as are used on telephone operators' control boards.

Speed in operating is an important factor, because a lost machine calling for position should be located by two stations, directions reported to a main control station, and the position given to the pilot

the shortest possible time. The whole of the above arrangement, where full control is given to one man, makes for speed in operating and economy in personnel.

The Transmitting House.—The transmitting room contains the various panels mounting the transmitting apparatus, the high-frequency inductance, and the machines and transformers.

There are two panels in all, the high-frequency panel, and the machine-control and charging panel.

The high-frequency panel mounts the valves, their lighting transformers, the smoothing condensers and chokes, the various phone control transformers and relays.

The machine-control panel carries various switches and fuses, necessary for the transmitting alternator circuits, together with arrangements for charging accumulators from a subsidiary motor generator. The accumulators are charged in a separate room so that acid fumes shall not interfere with the instruments, or the health of the station attendant.

All points at high potential are protected by safety devices so that fear of shock need be entertained.

The High-Frequency Panel.—Alternating current is fed from the machine direct on to the primary of the lighting transformer through a safety switch back on to a separate high-tension transformer, which is not mounted on the high-frequency panel.

The high-tension transformer has three terminals, its secondary being split. The centre point is earthed and the two others connected to the anodes of two rectifiers, so that double rectification takes place and both sides of the alternating current wave utilised. The high-tension supply is smoothed by means of a condenser and choke, and fed through a second high-frequency choke on to the oscillating circuit. There are two valves for the speech-control, a small 100-watt valve for the sub-control and a larger valve for the main-control. Variable resistances and transformers arrange for the speech variations to be magnified and relayed on to the high-frequency circuits. These transformers are mounted on the panel.

The valves themselves are carried behind two coarse-mesh-fronted doors, which swing open. The act of opening the doors cuts off all current from the set and short-circuits the smoothing condenser, so that there is no chance of shock on touching the anodes of the valves.

If the doors are opened the lower panel mounting the filament current adjusters can swing downwards and all the chokes, condensers, transformers, etc., are exposed and can be readily inspected without dismantling the set in any way.

It has been found advisable to provide filament ammeters in series with the valves so that filament brightness, a deceptive indication, is not the only gauge as to the correct adjustment of the current. These ammeters rise to dangerous potentials on the rectifiers, and are, therefore, mounted behind the safety door and can be inspected through a suitable window.

There are two other ammeters on the set, on reading the anode current to the oscillatory and control valves, the other the output current in the closed circuit.

Owing to the wavelength being limited to 900 metres damping-control is used for the transmission of telephony.

No inductances are incorporated with the panel, its functions

being merely to mount the necessary apparatus for setting up oscillatory currents in high-frequency circuits suitably connected.

The send-receive switch which cuts off the high-tension and changes over the aerial from "send" to "receive" is controlled remotely from the receiving house, as is also the starter for the motor alternator. Both the relays for operating these switches are embodied in the set.

They are mounted on the board which carries the ammeters immediately above the valve cabinet, and are readily accessible.

The roof the valve cabinet is composed of mesh-metal, so that good ventilation is assured for the valves.

All the panels are mounted back to the wall, and are carried on a framework which also serves to enclose the subsidiary units such as high-tension transformers, high-frequency condensers, etc.

The Machine-Control Panel.—A standard charging board is embodied in this unit with the necessary resistances, ammeters and voltmeters. Certain parts of the automatic motor starters are also carried and a main power switch cuts off power from all circuits. A switch is arranged which when changed over brings into action a spare alternator, so that fear of prolonged breakdown is minimised.

Aerial and Earth System.—The aerial system and the radiating system is designed to have the least possible resistance. To this end an earth screen is advised.

The aerial is of L construction, being supported on two 70-ft. steel masts, 200 feet apart. The aerial is composed of two "Sausages," consisting of four wires each and carried on a spreader ten feet apart. The lead-in is taken through a suitable insulator which is not screwed directly into the wall, but taken in through two insulating panels. This obviates dielectric loss.

The earth shield consists of spaced wires raised some feet above the earth and insulated.

Aircraft Installation.

The following is a brief description of the latest Marconi Aircraft Telephone and Telegraph Transmitter and Receiver, as employed on aeroplanes flying between London and the Continent.

The chief characteristic of the set is that it combines in one box both transmitter and receiver, connected permanently by cables to a small unit which carries all the handles necessary for control of the set. This small unit, called the Remote Control, can be mounted conveniently to the hand of the user, while the set proper can be stowed away permanently in the most convenient position. The principle of Remote Control enables the pilot, while flying, to have all the necessary adjustments for both sending and receiving either telegraphy or telephony in a very compact space.

The unit construction of transmitter and receiver is suitable for use in the larger types of aircraft, and scores in neatness of design; but where there are any small isolated spaces, as with fighting machines, separate receiver and transmitter are better used.

All the latest developments of Aircraft Wireless have been embodied in this set; elaborate screening to guard against magneto noise, high-frequency amplification with specially damped transformers, so that the receiver is both sensitive and stable; a variometer in the transmitter, to adjust the wavelength exactly, whatever the variations

in capacity of small accumulators.

The set described above is inter-connected on a single board, and fulfils all of the requirements where the set is used than when handled by a single operator, ever, will be a

Supply

power, both for the transmitter, and for the generator, is arranged so that the load is large ranges of power kept continuous, this accumulation to cope with machine increase to prevent the arranged value only comes in

The actual power supplies two units of power for the field coils, 1,500 volts, generator, are specially silenced filaments direct without fear of the received signals permanently connected switched either

The Receiver via a smoothing ripple, to the filter whether the load transmitter. V over, but is specially inactive by switch a rather complicated position it high connects the a generator, and receive position switched off an battery system

The two tuning condensers are for cutting near a ground

in capacity of various types of machine; and, lastly, the use of one small accumulator only which feeds both transmitter and receiver.

The set is an all-purpose arrangement in that it can be used as described above as a pilot-operated set, or, by shortening the various inter-connecting cables, the whole combination can be mounted on a single board, and an operator will have full power to make the set fulfil all of its many uses. It must, of course, be understood that where the set is controlled by an operator, greater flexibility will result than when handled simply from its Remote Control. A pilot, however, will be able to make it suit all his needs.

Supply of Power.—A small wind-driven generator supplies power, both high-tension for feeding the oscillatory circuits of the transmitter, and low-tension for the valve filaments. The accumulator is arranged to be floating across the low-tension commutator of the generator, and does not supply power to the filaments, but is arranged so that the low-tension voltage shall remain constant in spite of the large ranges of air speed of the aeroplane. The accumulator is thus kept continuously charged. If there were no regulator on the generator this accumulator would have to be large, and therefore heavy, in order to cope with the large charging currents that would occur on the machine increasing its flying speed. A regulator is therefore arranged to prevent the voltage of the generator rising above a certain pre-arranged value. This regulator is normally, therefore, quiescent, and only comes into action during the time of abnormal flying speeds.

The actual generator is of unusual design, inasmuch as it comprises two units, one, an exciter, giving 8 volts at 7 amperes, which supplies power for receiver and transmitter valve filaments, and current for the field coils of the second unit which supplies the high-tension, 1,500 volts, 0.1 amperes. Both these, exciter and high-tension generator, are contained in one streamline casing. The generator is specially silenced electrically, so that it is possible to supply the receiver filaments directly from the generator in parallel with the accumulator, without fear that the commutator hum will interfere at all badly with the received signal. Thus great weight is saved, since one accumulator, permanently connected across the low-tension of the generator, can be switched either to transmitter or receiver.

The Remote Control.—Power is fed from the generator, via a smoothing condenser unit which smoothes out the high-tension ripple, to the Remote Control where the send-receive switch determines whether the low-tension supply shall be diverted to the receiver or transmitter. When on the receive side the high-tension is not changed over, but is still on to the transmitter, but the latter is rendered inactive by switching off its valve filaments. Thus the switch fulfils a rather complicated function, inasmuch as when it is placed in the send position it lights the transmitter valves, switches on the high-tension, connects the accumulator across the low-tension commutator of the generator, and changes over the aerial to transmit. When in the receive position the aerial is changed over, the transmitter valves are switched off and the receiving are switched on, the low-tension floating battery system being maintained as before.

The two remaining handles apply to the receiver, and control the tuning condenser for adjusting to the correct wavelength, and a resistance for cutting down the loudness of the receiver speech when flying near a ground station.

The switch resistance and condenser are mounted on a flat base which is covered externally by a hemicylindrical cover. A small lamp is mounted inside the cover and serves to indicate whether the set is oscillating or not. This lamp is inductively shunted directly in the aerial circuit, and if it burns out the set will still continue to function. Only the levers are external to this cover, and all the delicate mechanism is shielded. The movement of the handles corresponds to that of ordinary engine control, and the appearance of the unit is in harmony with aeroplane design generally.

The Remote Control also forms a junction for all the wires connecting the various units. These wires are intended to be brought in at the base of the Remote Control, the bottom cover serving as a protection for the connections and an anchor for the wires so that strain is removed from the soldered joints if the cables are accidentally pulled.

All these wires are bunched appropriately, and each bunch is separately covered by flexible aluminium wire braiding. This acts as a mechanical and electrical protection, and helps, therefore, to eliminate magneto noise, and tends to prevent pinching or fraying of the contained wires. The aluminium cover is electrically connected to the metal flexible cable cover, and so complete screening is obtained. Connected by their cables to the Remote Control are the telegraph unit, the smoothing condenser, and the set (receiver and transmitter) proper. All the wires connected to the Remote Control are intended to be permanently and neatly mounted in the machine. The set proper can be disconnected by removing the plugs which connect the Remote Control to the set. Two plugs are used, one, heavily insulated, for the transmitter circuits, and the other for the receiver.

Transmitter.—The transmitter consists of the usual oscillatory circuits for the generation of continuous waves, and the low-frequency control-circuits for modulating the intensity of these waves, in sympathy with the voice. The former comprises a power-valve and its associated reaction and aerial coils. The aerial coil can be wound to any reasonable wavelength, but the standard arrangement will give 900 metres by the adjustment of the variometer. The wire used is highly stranded and pile-wound, so that a minimum of space and electrical resistance is obtained. The variometer is mounted on the aerial coil former, and once adjusted on the test flight need never again be touched. For an aerial length of 200 or more feet 900 metres should be obtainable with most machines whether large or small.

There is a wavelength switch, the movement of which cuts in or out a certain part of the aerial coil. Thus every set is capable of radiating two chosen wavelengths; with the standard windings these are 900 metres for the aircraft wave, and 600 for getting in touch with commercial and ship stations. This wavelength change cannot be effected from the Remote Control.

The reaction coil is semi-variable, but once set for a particular machine need never be touched.

The control-circuits embody a microphone transformer, choke, and control-valve, for amplifying the voltage variations of the former, and super-imposing these on the high-tension supply. This valve is not a useless load, inasmuch as it instantaneously arranges for an anode voltage sweep on the power-valve approximately double the maximum supplied by the generator; the whole control-circuits are

stable, and have been found very effective in their application both in peace and war to aircraft wireless telephony.

The Receiver.—This is a five-valve circuit consisting of 3-h.f. magnifications, one detector valve, and one note magnifier.

The valves are lighted from the low-tension commutator of the exciter, and fed with high-tension from a battery contained in a box which is held by ebonite-headed screws at the bottom of the set. Two of these screws form the connection from the receiver to the high-tension, while the rest are arranged symmetrically to give further support, and to form feet for the whole set to stand on when on the bench.

The condenser in the Remote Control makes fine variations of wavelength around a fixed wave (900 metres in the standard set). When used as an operator-controlled set, however, it is possible to obtain wavelengths from 1,000 to 450 metres.

This is done by providing an inductance tapping switch, triangular in shape, mounted on top of the box. This has three positions, short, medium, and long, and so provides a coarse wavelength adjustment, the finer changes being given by the movement of the condenser in the Remote Control.

The aerial circuit is inductively coupled to the first high-frequency valve through a so-called aperiodic coil. This coil, when loosely coupled to the aerial circuit, has a natural wavelength equal to that of the standard wave to be worked to. On tightening the coupling, however, the mutual inductance of aerial and aperiodic coil tends to bring in two possible resonance points, one higher and one lower than the wave obtained with loose coupling. Thus by varying the coupling of the aperiodic coil the secondary circuit is tuned, and by varying the coarse wavelength switch in combination with the Remote Control condenser, the aerial circuit is tuned. Thus on the standard wave all the advantages of loose coupling are obtainable, but a large range of other waves is possible by a simple secondary adjustment. The coupling handle is on the left-hand side of the box, and when pushed home gives loose coupling, when pulled out lower or higher ranges are obtainable.

Screening is carried out very thoroughly. The whole of the high-frequency circuits are screened in one metal box, and, further, the aperiodic and aerial coils are screened themselves from the high-frequency transformers. This prevents spurious oscillation, and makes for stability. Reaction, however, is arranged for so that the set can be made to oscillate and work as an auto-heterodyne circuit for the reception of continuous waves, or can be given increased sensitivity for the reception of weak signals by increasing the reaction. These adjustments are made by a twist handle mounted below the coupling handle, and is not greatly affected by wavelength changes or filament maximum of sensitivity is obtained consistent with stability.

The high-frequency transformers are damped very heavily so that the reaction adjustment is fully controllable from the appropriate handle, and is not greatly affected by wave length changes or filament brightness.

In order to cut down too loud signals the valve filaments are dimmed by means of the Remote Control variable resistance.

Low-resistance telephones are used connected across the secondary terminals of a step-down iron transformer, so that no fear of

demagnetizing the phones by the anode current through the note-magnifying valve need be entertained. The necessary wires leading from the Remote Control to the receiver terminate in a plug which can be disconnected if the set is removed from the machine.

The Telegraph Unit.—This unit, permanently connected to the Remote Control, mounts a key, buzzer, and switch. In one position, the key is arranged to cut up the continuous waves into Morse by opening and closing the grid resistance, and so will give continuous wave transmission. In the second position of the switch a buzzer replaces the microphone, the control-valve becomes operative, and interrupted-continuous wave is sent out. A third contact on the switch short-circuits the key, and throws the microphone into circuit in place of the buzzer, and so telephony can be transmitted.

The telegraph unit can be mounted under the pilot's hand, who, therefore, by the simple movement of a 3-way switch, can send out any of the three types of permissible transmission—Interrupted Continuous Waves, Continuous Waves, or Telephony.

There is, lastly, a plug connected to the telegraph unit with the female portion permanently fixed and the male portion connected to the pilot's microphone and telephones. Thus, when the pilot gets out from his machine he only unplugs once and is completely free from his wireless gear, removing his helmet and head receivers, his coat and his microphone in one.

The whole design is best worked out by embodying a breast microphone for the pilot's use. He then has his hands free for all adjustments, wireless an aeroplane control.

Suspension.—The set is provided with lugs to which shock-absorber rubber is attached so that it can be suspended free from mechanical shock.

Winch.—The winch is simple in operation. The winding-up handle embodies the brake so that all the pilot has to do when letting out the aerial is to draw back the handle and regulate the speed of running out by pressing it forward. When fully wound the winch cannot run out, automatically locking itself.

Weight.—The weight is approximately 60lbs., made up as follows:

Transmitter and Receiver Box, with H.T. Battery	17
Remote Control	2
Microphone and Handle	1
Telegraph Unit	1½
Smoothing Condenser	3
Generator and Propeller	16
Accumulator	7
Winch and Fairlead	5
Aerial Wire and Weight	3
Cables and Plugs	5
Head Receivers	1
Suspension Brackets	1½

Total ... 63

Dimensions.—Transmitter and Receiver Box with H.T. Battery: 14½ins. x 6½ins. x 10ins. high. Remote Control: 5ins. x 4½ins. Projection above dashboard, 3ins. Smoothing Condenser: 7 ins. x 4½ins. x 2½ins. Telegraph Unit: 4½ins. x 2½ins. x 2½ins.

THE MARKING OF AIRCRAFT

(A) The nationality mark shall be represented by capital letters in Roman characters—*e.g.*, France, F.

The registration mark shall be represented by a group of four capital letters; each group shall contain at least one vowel, and for this purpose the letter Y shall be considered as a vowel. The complete group of five letters shall be used as a call sign of the particular aircraft in making or receiving signals by wireless telegraphy or other methods of communication, except when opening up communication by means of visual signals, when the usual methods will be employed. The nationality and registration marks are assigned in accordance with the table.

(B) On aircraft other than State and commercial, the registration mark shall be underlined with a black line.

TABLE OF MARKS

The nationality mark of the State named below applies to the aircraft of its Dominions, Colonies, Protectorates, Dependencies, or of countries of which it is the Mandatory Power.

Country.	Nationality Mark.	Registration of Marks.
United States of America ..	N	All communications made in accordance with the provisions of Section 1 (4) using a group of four letters out of the 26 of the alphabet, each group containing at least one vowel—e.g., ADCJ, PURN
British Empire	G	
France	F	
Italy	I	
Japan	J	All communications made with B as first letter. <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " C " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " P " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " R " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " U " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " B " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " G " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " L " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " B " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " P " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " B " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " P " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " C " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " H " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " S " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " H " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " S " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " E " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " G " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " P " </div> <div style="display: flex; justify-content: space-between; width: 100%;"> " " " " H " </div>

GENERAL INFORMATION

UNITED STATES OF AMERICA

The Military Air Service is controlled by the War Department of the United States. Below is copy of a letter of instruction from the Office of the Chief of Air Service, dated February 4th, 1920, outlining the indicatives or call letters assigned for the permanent use of the Air Service.

It is proposed, as a part of the 1922 Air Service projects, that long-distance wireless communications stations will be installed and used, both for inter-field communication and for the dissemination of meteorological data to aircraft. It is contemplated that these stations will be located at the following listed fields and stations:—

Mitchel Field, Mineola, L.I., N.Y.
 Langley Field, Hampton, Va.
 Carlstrom Field, Arcadia, Fla.
 Ellington Field, Houston, Tex.
 El Paso, Texas.
 San Diego, Cal.
 Crissy Field, Calif.
 Camp Lewis, Wash.
 Selfridge Field, Mt. Clemens, Mich.

The Signal Corps is planning the installation of radio stations throughout the United States, for the purpose of disseminating meteorological data to aircraft, which will be received by ground wire from the Weather Bureau officials.

WAR DEPARTMENT.

OFFICE OF THE DIRECTOR OF AIR SERVICE, WASHINGTON.

February 4th, 1920.

R OF INSTRUCTION

No. 2.

: RADIO OFFICERS, ALL AIR SERVICE ACTIVITIES.

Subject: Radio Call Letters, or Indicatives, for all Air Service Radio Stations.

A block of indicatives, or call letters, has been assigned for the present use of the Air Service. The indicatives are divided into five divisions—i.e., V, W, X, Y and Z. The indicatives are to be made of two letters and one figure. The first letter of the indicative is to be one of the above letters. The five main divisions are assigned as follows:—

Western Department.. ..	VA1 to VZ0
Central Department	WA1 to WZ0
Eastern and South-Eastern Department	XA1 to XZ0
Insular Possessions	YA1 to YZ0
Southern Department	ZA1 to ZZ0

The indicatives will be effective at 00.1 o'clock on April 1st, 1920. Officers in charge of Air Service radio stations are responsible for the execution of the change of indicatives with any stations with which they are working.

Indicatives for the squadrons will be assigned by the Group Radio Officer under which the squadron is operating, from the block of indicatives assigned to the Group, and indicatives for the airplanes of a squadron will be assigned by the squadron radio officer from the block of indicatives assigned to the squadron by the Group Radio Officer.

As soon as the blocks of indicatives have been assigned the squadron Group Radio Officer, he will send a copy to the Wing Radio Officer, who, in turn, will submit a copy of complete assignment to this Office, through the Group Radio Officer.

Attached are the assignments of indicatives for Departments, Wings and Groups, and the reserve indicatives allotted to each.

By direction of the Director of Air Service,

WM. F. PEARSON,

Colonel, A.S.A.,

Administrative Executive.

(a) Reserve—for assignment to squadron and airplane ..	XK2 to XM0
Aberdeen Proving Grounds, Aberdeen, Md.	XN1
(a) Reserve—for assignment to squadron and airplane ..	XN2 to XO0
Carlstrom Field, Arcadia, Florida ..	XP1
(a) Reserve—for assignment to squadron and airplane ..	XP2 to XS0
Pope Field, Fayetteville, North Carolina..	XU1
(a) Reserve—for assignment to squadron and airplane ..	XU2 to XU0

NOTE : 0 signifies "zero."

INSULAR POSSESSIONS.

YA1 to YZ0

STATION.	CALL LETTERS.
Philippine Islands, A.S. Headquarters ..	YA1
(a) Reserve—for assignment to squadron and airplane ..	YA2 to YF0
Hawaiian Islands	YG1
(a) Reserve—for assignment to squadron and airplane ..	YG2 to YK0
Panama Canal Zone	YL1
(a) Reserve—for assignment to squadron and airplane ..	YL2 to YP0

SOUTHERN DEPARTMENT.

ZA1 to ZZ0

STATION.	CALL LETTERS.
Kelly Field, San Antonio, Texas ..	ZZ1
(a) Reserve—for assignment to squadron and airplane ..	ZZ2 to ZZ0
First Wing Headquarters	ZA1
(a) Reserve—for assignment to squadron and airplane ..	ZA2 to ZA0
First Surveillance Group	ZB1
(a) Reserve—for assignment to squadron and airplane ..	ZB2 to ZJ0
First Day Bombardment Group ..	ZK1
(a) Reserve—for assignment to squadron and airplane ..	ZK2 to ZR0
First Pursuit Group	ZS1
(a) Reserve—for assignment to squadron and airplane ..	ZS2 to ZY0

The Postal Radio Service is owned and operated by the Post Office Department.

The United States Air Mail Service has been experimenting with aircraft radio since February, 1919. Its principal efforts have been directed to the solution of the problem of Radio Direction Finding and Radio Field Localising. The solution of these problems has been pursued with the aid of the Bureau of Standards and data furnished by the Navy Department, with considerable original research by the Air Mail Service. A simplified Radio Direction Finder, based on the Robinson principle of fixed A and B coils, was evolved, and has been practically applied to single-manned planes of this service. Pilots with no previous experience have flown directly over the radio stations at destination by this means.

The problem of field localizing jointly solved by the Air Mail Service and the Bureau of Standards, has resulted in the discovery and practical application of the so-called Radio Frequency Field Localiser System. This system, in brief, consists of two large horizontal single-turn coils in which radio frequency currents flow in opposite directions. As a result, the electromagnetic field extends upward in an expanding cone. An aeroplane utilising radio direction finding during periods of poor visibility can, of course, fly to the vicinity of the landing field. From this point the field localizer directs them to the immediate vicinity of the field itself.

NOTE : 0 signifies " zero."

During August, 1920, it was found that telegraph communication could not be furnished for the trans-continental Air Mail Service. As a result, it was decided on August 20th to instal a chain of radio stations across the continent, tying in each of the Air Mail fields.

There are eleven of these stations installed on or near various Air Mail fields. Those in operation are (1) College Park, Md. 2 kw. Quenched Spark, (2) Bellefonte, Pa. 5 kw. Quenched Spark, (3) Omaha, Neb., 5 kw. Quenched Spark, (4) Cheyenne, Wyo., 2 kw. Arc.

Stations located at the following points have been in operation since October 15th:—(1) Salt Lake City, Utah, 2 kw. Arc; (2) Elko, Nevada, 2 kw. Arc; (3) Reno, Nevada, 2 kw. Arc. The following stations were completed on November 1st, 1920:—(1) St. Louis, Mo., 5 kw. Quenched Spark; (2) North Platte, Nebr., 2 kw. Arc; (3) Rock Springs, Wyo., 2 kw. Arc.

These stations are not only used for inter-station traffic, but are also utilised for aeroplane radio communication and radio direction finding.

It is proposed to utilise all the radio stations of the Air Mail Service for Radio Research work, such as investigation of shifting signals, static and other kindred problems.

GERMANY

The Koenigs Wusterhausen Station (Call Letters, LP) sends out notices for aircraft on a 3,600-metre wave at 1010 and 2010.

USEFUL DATA SECTION

(A) Wireless Terminology : --

(i) Definitions.

(ii) Foreign Equivalents.

(B) General Information and Useful Tables.

USEFUL DATA

*Specially Revised for the Year-Book by E. V. Appleton, M.A. (Cantab.),
M.Sc. (Lond.).*

IN view of the increasing amount of space taken up by other sections it proved impossible to continue the development and expansion of this section *within the Year-Book* so as to meet all the requirements of the recent phenomenal growth of the radio art. Moreover, such a course would hardly seem desirable, as such information could only be adequately treated in a volume wholly devoted to the subject. We therefore publish a separate volume under the title *Standard Tables and Equations in Radiotelegraphy*, compiled and edited for "The Wireless Press, Ltd.," by Bertram Hoyle, M.Sc. (Tech.), A.M.I.E.E.

The whole of the following section has been revised and brought up to date, and space has also been found for several additional features. It is natural to associate the later development of radiotelegraphy with the evolution of the thermionic valve, and in view of this a table of Atomic and Electronic Data has been added, together with a consistent scheme of symbols and terms for quantitative valve work. The list of definitions has also been expanded so as to include all the present valve nomenclature. In spite of the amount of work already done, thermionic valve and allied wireless problems still offer an extensive and profitable field for investigation to both amateur and professional wireless men, and in this connection a convenient and adequate system of recording circuits used is required. We have, therefore, included a sub-section on the conventional symbols commonly used in wireless diagrams.

WIRELESS TERMINOLOGY

(A) Definitions.

NOTE.—Terms are generally arranged alphabetically according to the noun referred to.

1. **AERIAL.**—The system of conductors designed to radiate, or absorb electro-magnetic waves.

2. **AERIAL CIRCUIT.**—The circuit comprising the aerial conductors, the earth conductors, and all inductances and condensers connected between them. As the aerial wires possess capacity with respect to the earth and the aerial conductors themselves possess inductance the aerial circuit has a natural oscillation frequency.

3. **AERIAL RESISTANCE.**—(See Antenna Resistance.)

4. **ÆTHER.**—See Ether.

5. **ALTERNATING CURRENT.**—One which reverses its direction periodically with time, the "periodic time" being the interval between two successive maxima of current in the same direction.

6. **ALTERNATOR.**—A rotating machine which transforms mechanical energy into electrical energy, producing at its terminals one or more alternating E.M.F.'s (single phase or polyphase).

7. **AMMETER (HOT BAND: HOT WIRE).**—An ammeter dependent for its indications upon the change in dimensions of an element which is heated by a current through it. In most cases the expansion of the wire is measured by the alteration in the amount of sag.

8. **AMMETER, THERMO.**—An instrument for measuring current, depending for its indications on the voltage generated at the terminals of a thermo junction heated either directly or indirectly by the current to be measured.

9. **AMPERE-TURN.**—The unit of magneto motive force. In an air case solenoid the magneto motive force is equal to the product of the number of turns of the coil and the amperage through the coil.

10. **AMPLIFIER OR AMPLIFYING RELAY.**—An instrument which modifies the effect of a local source of energy in accordance with the variations of received energy; and in general produces a larger indication than could be had from the incoming energy alone. Most modern amplifiers consist of arrangements of three-electrode valves in cascade, the inter-valve connections being made by transformers, high resistances or condensers or by combinations of these.

11. **AMPLIFIER, HIGH FREQUENCY.**—An amplifier designed for the amplification of high or radio frequency oscillations. In a valve amplifier of this type air core transformers are commonly used as the inter-valve connections.

12. **AMPLIFIER, LOW FREQUENCY.**—An amplifier designed for the amplification of low or audio-frequency signals. In a valve amplifier of this type iron core transformers are commonly used as the inter-valve connections.

13. **AMPLIFICATION, CO-EFFICIENT OF.**—The ratio of the useful effect obtained by the employment of the amplifier to the useful effect obtained without that instrument. In particular the amplification constant of a thermionic valve may be defined as the ratio of the slopes of the grid voltage—
anode current and the anode voltage—
anode current characteristics at any operating point.

14. **AMPLITUDE.**—The maximum value of current or voltage attained during any half period of an alternating current or voltage is called the amplitude during that half period.

15. **ANGULAR VELOCITY (or ANGULAR FREQUENCY).**—Of a periodic alternating current or voltage is the product of 2π and the frequency in cycles per second.

16. **ANODE.**—(a) In an electrolytic cell. The conductor through which the current enters the liquid.

(b) In a primary cell. The metal (usually zinc) through which the current enters the electrolyte. It is also termed the negative terminal.

(c) The terminal by which the current enters a cell or other apparatus, such as a vacuum tube, thermionic valve, etc. In a thermionic valve the anode is often termed the "plate" or less commonly the "sheath."

17. **ANODE CIRCUIT.**—See Plate Circuit.

18. **ANTENNA.**—See Aerial.

19. **ANTENNA, DIRECTIVE.**—An antenna having the property of radiating a maximum energy in one (or more) directions.

20. **ANTENNA, FLAT TOP.**—An antenna having horizontal wires at the top covering a large area.

21. **ANTENNA, HARP.**—An antenna having an approximately vertical section of large area and considerable width.

22. **ANTENNA, INVERTED L.**—A flat top antenna in which the leading down wires are taken down from one end of the long horizontal section.

23. **ANTENNA, LOOP.**—An antenna in which the wires form a closed circuit part of which may be the ground.

24. **ANTENNA, PLAIN.**—An approximately vertical single wire.

25. **ANTENNA, T.**—A flat top antenna in which the horizontal section is long and narrow, the leading down wires being taken from the centre.

26. **ANTENNA, UMBRELLA.**—An antenna the conductors of which form the elements of a cone from the elevated apex of which the leading down wires are brought.

27. **ANTENNA RESISTANCE.**—Is that resistance which if inserted at the antinode of current in the antenna would dissipate the same power as that radiated by the antenna.

Antenna resistance includes :

- (a) Radiation resistance.
- (b) Ground or earth resistance.
- (c) Radio frequency ohmic resistance of antenna and loading coil and shortening condensers.
- (d) Equivalent resistance due to corona, eddy currents, and insulator leakage.
- (e) Absorption in neighbouring imperfect dielectrics.

28. APERIODIC CIRCUIT.—A circuit which has no definite time period, this being due either to its resistance being large enough to prevent natural oscillations occurring or to its having no capacity or no inductance and therefore no oscillatory properties.

29. ARC.—"A luminous discharge of electricity through a gas in which the material of one or both the electrodes is volatilised and takes part in the conduction of the current, whether continuous or alternating" (B.E.C.). **ARC.**—The passage of an electric current of relatively high density through a gas or vapour the conductivity of which is mainly due to the electron emission from the self-heated cathode. Under present practical conditions the phenomena take place near atmospheric pressure (I.R.E.).

30. ARC OSCILLATOR.—An arc used with an oscillating circuit for the conversion of direct to alternating or pulsating current. The oscillations generated are classified as follows:—

Class (1).—Those in which the amplitude of the oscillation circuit current produced is less than the direct current through the arc.

Class (2).—Those in which the amplitude of the oscillation circuit current is at least equal to the direct current, but in which the direction of the current through the arc is never reversed.

Class (3).—Those in which the amplitude of the initial portion of the oscillation circuit current is greater than the direct current passing through the arc, and in which the direction of the current through the arc is periodically reversed.

31. ARRESTER, EARTH.—A spark gap with a small gap and large sparking surfaces; used to protect receiving apparatus from powerful discharges.

32. ASYNCHRONOUS.—"A term applied to an A.C. generator or motor, the speed of which has no fixed relation to the frequency of the current" (I.E.C.).

33. ATMOSPHERIC ABSORPTION.—That portion of the total loss of radiated energy due to atmospheric conductivity, reflection, and refraction.

34. ATMOSPHERICS.—Disturbances produced in the receiving circuits caused by electrical action in the atmosphere or in the earth's surface. They are also known as "X's," "Strays," or "Parasitic Signals," and in the U.S.A. as "Static."

35. ATTENUATION (RADIO).—This is the decrease, with distance from the radiating source, of the amplitude of the electric and magnetic forces constituting an electro-magnetic wave.

36. ATTENUATION, CO-EFFICIENT OF (RADIO).—The co-efficient, which when multiplied by the distance of transmission through a uniform medium, gives the natural logarithm of the ratio of the amplitude of the electric or magnetic force at that distance to the initial value of the corresponding quantity.

37. AUDIBILITY.—The ratio of the telephone current variation producing the received signal to that producing a just audible signal—*i.e.*, one which permits the mere differentiation of dots and dashes.

The measurement of audibility is an arbitrary method for determining the relative loudness of telephone response in radio receivers, in which it is stated that a signal has an audibility of given value. The determination of the above ratio may be made by placing a resistance in parallel with the telephone and reducing its value until the limit of audibility is reached. The

audibility of the given signals is then given by $\frac{s+t}{s}$ where s is the impedance of the shunt and t the impedance of the telephone for the frequency and wave-form of the impulses through it.

38. **AUTODYNE RECEPTION** (also termed **ENDODYNE RECEPTION**).—A scheme of reception for continuous waves in which the receiver itself generates the local oscillations required for the production of a beat note with the incoming oscillations.

39. **AUTO-JIGGER**.—See Jigger.

40. **AUTOMATIC RECEIVER**.—A receiver which records signals so they can be translated at any convenient time after reception.

41. **AUTO-TRANSFORMER**.—A coil with a core of air or iron in which the primary and secondary windings have a number of turns in common.

42. **AUTOMATIC TRANSMITTER**.—A transmitter which has the usual operating key replaced by any mechanical telegraph sender such as a Wheatstone transmitter.

43. **BALANCING AERIAL**.—An aerial used in duplex wireless telegraphy. It fills a purpose similar to that of the artificial line in duplex wire telegraphy.

44. **BATTERY**.—A primary or secondary cell for producing electric current or a collection of such units. A collection of condenser units.

45. **BEAT**.—When two oscillations of slightly different frequencies are impressed on an electrical circuit they periodically help and oppose each other. The result is an oscillation the amplitude of which varies in a regular and periodic manner. The time between two successive maxima of amplitude is called the period of the beat. The beat frequency is equal to the difference of the frequencies of the component oscillations.

46. **BLUE GLOW**.—In a soft thermionic valve is the emission of light which accompanies intense ionisation by collision.

47. **BRUSH DISCHARGE**.—"A discharge having a feathery form, and consisting of an intermittent partial discharge which takes place from a conductor when the potential difference exceeds a certain limit, but is not high enough to cause the formation of a true spark or arc. It is always accompanied by a hissing or cracking sound" (I.E.C.). When such a discharge is being given off by a conductor the latter is said to be "Brushing."

48. **BRUSH OR CORONAL LOSSES**.—Those due to leakage convection electric currents through a gaseous medium.

49. **BUZZER**.—A small mechanism (usually electromagnetic) used for rapidly making and breaking an electric circuit. When connected in series with part of a circuit in which oscillations are possible it continually impulses the circuit, thereby producing oscillations which are convenient for testing purposes.

50. **CAGE CONDUCTOR**.—A group of parallel wires arranged as the elements of a long cylinder.

NOTE.—Any conducting element of an antenna may be a cage conductor.

51. **CAPACITY**.—That property of a material system by virtue of which it is capable of storing energy electrostatically. The capacity of a system is dependent on its geometrical dimensions, its position relative to other conductors and the dielectric constants of the surrounding media.

Capacity is measured by the ratio of the quantity of electricity stored to the potential difference at which it is stored.

A distinctive property of a capacity is that it permits the passage of electrical energy through it only in the form of displacement currents. The

reactance of a capacity C for such currents is equal to $\frac{1}{Cp}$ where p is the angular frequency of the alternating current.

52. **CAPACITY, EFFECTIVE, OF AN ANTENNA**.—The effective capacity and effective inductance of an antenna at any oscillation frequency are the

equivalent capacity and inductance values determined from the following fundamental equations :

$$\omega = \sqrt{\frac{1}{LC}} \quad \dots \dots \dots (1)$$

where L = the total antenna inductance.

C = the total antenna capacity,

ω = the angular velocity of the free alternating currents in the antenna.

$$d = \pi R \sqrt{\frac{C}{L}} \quad \dots \dots \dots (2)$$

or
$$d' = \pi R' \sqrt{\frac{C}{L}} \quad \dots \dots \dots (2a)$$

where R' = series resistance inserted at the base of the antenna and
 d' = increased decrement resulting therefrom.

Solving (1) and (2a) for L and C , we have

$$L = \frac{\pi R'}{\omega d'} = \frac{R'}{6 \times 10^8 \times d'} \quad \lambda \quad (\lambda \text{ in meters}).$$

$$C = \frac{d'}{R'} = \frac{d'}{6 \pi^2 \times 10^8 \times R'} \quad \lambda \quad (\lambda \text{ in meters}).$$

Having the antenna inductance and capacity, the resistance R of the antenna can be determined from equation (2). This value of R satisfies the fundamental equation :

RI^2 = power absorbed by the antenna,

where I = current measured at the base of the antenna.

NOTE.—The equation

$$I = \omega CE$$

$$\left(\text{and also } E = \frac{\pi R'}{d'} \cdot I \right)$$

defines an effective voltage E , which is the voltage approximately given by the equation. Energy per spark = $\frac{1}{2}CE^2$.

A useful approximate formula for the fundamental wavelength of an inverted L antenna is the following :

$$\lambda \text{ (metres)} = 1,884 \sqrt{\left(L + \frac{L_o}{3}\right) C},$$

where C_o is calculated static capacity,

L_o is ordinary calculated inductance in microhenries.

L is inductance of loading coil in microhenries.

53. CATHODE.—See Kathode.

54. CATHODE OF THERMIONIC VALVE.—See Filament.

55. CENTRE OF CAPACITY OF AN ANTENNA.—See Form Factor, Note 2.

56. CHANGER, FREQUENCY.—A device delivering alternating currents at a frequency which is some multiple of frequency of the supply current.

57. CHANGER, WAVE.—A transmitting device for rapidly and positively changing the wavelength.

58. CHARACTERISTIC CURVE.—A curve showing the variation of a property of a material or a piece of apparatus when submitted to a changing influence which produces that variation.

The characteristic curves of a thermionic valve or arc or crystal show the relations between the various applied potentials and resulting currents.

59. **CHARACTERISTIC, DYNAMIC, OF A CONDUCTOR** (for a given frequency and between given extremes of impressed E.M.F. and resultant current through the conductor).—This is the relation given by the curve obtained when the impressed E.M.F.'s are plotted as ordinates against the resultant currents as abscissas, both E.M.F.'s and currents varying at the given frequency and between the given extremes.

60. **CHARACTERISTIC, STATIC, OF A CONDUCTOR**.—This is the relation given by the curve plotted between the impressed electromotive force as ordinates and the resultant current through the conductor as abscissas, for substantially stationary conditions.

61. **CHOKING COIL**.—"A coil with so great a self-induction that its impedance depends chiefly on the self-induction rather than upon the resistance" (I.E.C.). Generally called a Reactance Coil in U.S.A.

62. **CIRCUIT, CLOSED OSCILLATING**.—A circuit in which the capacity and inductance in series are localised substantially in different places, and which has very small power of radiating electromagnetic waves.

63. **CO-EFFICIENT, ATTENUATION, RADIO**.—See Attenuation.

64. **CO-EFFICIENT OF AMPLIFICATION**.—See Amplification.

65. **CO-EFFICIENT OF COUPLING, INDUCTIVE**.—The ratio of the effective mutual inductance of two circuits to the square root of the product of the effective self-inductances of each of these circuits.

66. **CODE**.—A system of conventional characters designed to represent letters by dots and dashes. The International Morse Code is official.

67. **COHERER**.—A form of detector (q.v.). An imperfect contact or collection of such contacts so arranged that when under the influence of an alternating potential it coheres and allows current from a local battery to pass and make some kind of signal. A device sensitive to radio frequency energy, and characterised by (1) a normally high resistance to currents at low voltages, (2) a reduction in resistance on the application of an increasing electromotive force, this reduction persisting until eliminated by the application of a restoring or disturbing mechanical force, and (3) the substantial absence of thermo-electric or rectifying action.

68. **COMMUNICATION RADIO**.—The transmission of signals by means of electromagnetic waves originating in a constructed circuit.

69. **COMPASS RADIO**.—A radio receiving device for determining the direction (or the direction and its opposite) in which maximum energy is received; or

A radio transmitting device for determining the direction (or the direction and its opposite) of maximum radiation.

70. **CONDENSER**.—A material system possessing electrostatic capacity. Two conducting surfaces separated by a dielectric.

71. **CONDENSER, AIR**.—A condenser having air as its dielectric.

72. **CONDENSER, COMPRESSED GAS**.—A condenser having compressed gas as its dielectric.

73. **CONDUCTOR CAGE**.—See Cage Conductor.

74. **CONJUGATE MUTUAL CONDUCTANCE** of a thermionic valve is given by the slope of the anode voltage-grid current characteristic at any operating point.

75. **CONTINUOUS CURRENT**.—A term recommended by the I.E.C. to supersede "direct current" as a description of "an electric current in one direction and sensibly steady or free from pulsation. Abbreviated CC."

76. **CONTINUOUS WAVES**.—The term applied to waves radiated from an aerial in which oscillations are sustained. Continuous waves may have successive half periods of equal amplitude, or the amplitude may vary within small limits without detriment to their use for wireless telegraphy.

77. **CONTROL ELECTRODE OF THERMIONIC VALVE**.—See Grid.

78. CONVECTION CURRENT.—A transfer of electrical energy by separate charged particles.

79. CONVERTER, ROTARY.—A machine for converting electrical energy of one form of current to electrical energy of another form, such as from alternating current to continuous or *vice versa*.

80. CORONA.—See Brush or Coronal Losses.

81. COUNTERPOISE.—A system of electrical conductors forming one portion of a radiating oscillator the other portion of which is the antenna. In land stations, a counterpoise forms a capacitive connection to ground.

82. COUPLER.—An apparatus which is used to transfer radio frequency energy from one circuit to another by associating portions of these circuits.

83. COUPLER, CAPACITIVE.—An apparatus which, by electric fields, joins portions of two radio frequency circuits, and which is used to transfer electrical energy between these circuits through the action of electric forces.

84. COUPLER, DIRECT.—A coupler which magnetically joins two circuits having a common conductive portion.

85. COUPLER, INDUCTIVE.—An apparatus which by magnetic forces joins portions of two radio frequency circuits.

86. COUPLING.—The connection between two circuits enabling energy to be transferred from one to the other. The connection may be by magnetic linkage, electrostatic linkage, direct connection, or any combination of these.

87. COUPLING, CO-EFFICIENT OF, in inductively coupled system is the ratio of the mutual inductance of the two circuits to the square root of the product of the self-inductance of the circuits. The coefficient of coupling (k) between two circuits tuned to the same frequency and then coupled, is also given by the formula :—

$$k = \frac{\lambda_1^2 - \lambda_2^2}{\lambda_1^2 + \lambda_2^2}$$

where $\lambda_1 \lambda_2$ are the longer and shorter resulting natural wavelengths of the coupled system.

88. CRITICAL RESISTANCE.—That resistance which is just sufficient to prevent free oscillation in an electrical circuit. If L inductance,

C Capacity, then Critical Resistance = $\sqrt{\frac{4L}{C}}$.

89. CRYSTAL DETECTOR.—A detector which uses the rectifying properties of the contact between a crystal and a metal surface or between two crystals.

90. CURRENT, DAMPED ALTERNATING.—An alternating current whose amplitude progressively diminishes. (Also called oscillating current.)

91. CURRENT, FORCED ALTERNATING.—A current, the frequency and damping of which are equal to the frequency and damping of the exciting electromotive force. See further, Current, Free Alternating.

NOTE 1.—During the initial stages of excitation, both free and forced currents co-exist.

92. CURRENT, FREE ALTERNATING.—The current following any transient electromagnetic disturbance in a circuit having capacity, inductance, and less than the critical resistance. See further, Resistance, Critical.

93. CURVE, DISTRIBUTION, OF A RADIO TRANSMITTING STATION FOR A GIVEN DISTANCE.—This is a polar curve the radii vectors of which are proportional to the field intensity of the radiation at that distance in corresponding directions. See also Compass, Radio.

NOTE 1.—The distribution curve depends, in general, not only on the form of the antenna, but also on the nature of the ground surrounding the station.

NOTE 2.—The distribution curve generally varies with the distance from the station.

94. **CURVE, RESONANCE, STANDARD.**—A curve the ordinates of which are the ratios of the square of the current at any frequency to the square of the resonant current, and the abscissas are the ratios of the corresponding wavelength to the resonant wavelength; the abscissas and ordinates having the same scale.

95. **CYCLOGRAM.**—See Characteristic Dynamic.

96. **CYCLOGRAPH.**—An instrument for the production of cyclograms.

97. **CYMOMETER.**—A "wave-measurer." See Wavemeter.

98. **DAMPING.**—The diminution of energy in an electrical circuit resulting from loss of energy.

99. **DAMPING FACTOR (of a simple circuit).**—The ratio of the effective resistance of that circuit to twice the effective inductance (the reciprocal of a time). This term applies only to circuits capable of carrying free alternating currents.

100. **DECREMENT.**—See Decrement, Linear, and Logarithmic.

101. **DECREMENT, OF A LINEARLY DAMPED ALTERNATING CURRENT.**—This is the difference of successive current amplitudes in the same direction divided by the larger of these amplitudes.

NOTE.—Let I_n and I_{n+1} be successive current amplitudes in the same direction of a linearly damped alternating current.

Then, the linear decrement, which is not a constant but varies with the amplitude,

$$b = \frac{I_n - I_{n+1}}{I_n}$$

Also: $I_t = I_o (1 - bft)$,

where I_o = initial current amplitude,

I_t = current amplitude at time t ,

f = frequency of alternating current.

$b = (I_o - I_1) / I_o$.

102. **DECREMETER.**—An instrument for measuring the logarithmic decrement of a circuit or of a train of electromagnetic waves.

103. **DETECTOR.**—That portion of the receiving apparatus which, connected to a circuit carrying currents of radio frequency, and in conjunction with a self-contained or separate indicator, translates the radio frequency energy into a form suitable for operation of the indicator. This translation may be effected either by the conversion of the radio frequency energy, or by means of the control of local energy by the energy received.

104. **DEVICE, ACOUSTIC RESONANCE.**—A device which utilises in its operation resonance to the audio frequency of the received signals.

105. **DIELECTRIC.**—Any medium which will only allow of electric conduction to a small or negligible extent.

106. **DIELECTRIC CONSTANT (or Specific Inductive Capacity) of a medium.** The ratio of the capacity of a condenser having that medium as a dielectric to the capacity of a condenser having a vacuum dielectric, but otherwise identical. (The dielectric constant of air is substantially unity, and therefore for all practical purposes air may be used in place of the vacuum in the comparison condenser.)

107. **DIELECTRIC HYSTERESIS.**—That lagging property of a dielectric which is measured by the energy lost when the rising and falling (displacement current)—(Voltage) characteristics (dynamic) are not identical.

108. **DIELECTRIC HYSTERETIC CONSTANT** of a given dielectric The value of the dielectric hysteresis per cycle per unit of potential gradient applied to the dielectric.

109. **DIFFRACTION** is the deviation of the direction of propagation of a wave from the normal to the wave front at the point where the waves pass

the edge of an obstruction. The amount of diffraction depends on the wavelength and increases with increase of wavelength.

110. **DIPLEX TELEGRAPHY** is the simultaneous transmission or the simultaneous reception of two messages at the same station.

111. **DIRECT COUPLING**.—When one circuit is linked to another in such a way that a portion of the one forms part of the other they are said to be direct-coupled. An example is provided in the auto-jigger (*vide* Jigger), in which a portion of the inductance is common to two circuits.

112. **DIRECTION FINDER, WIRELESS**.—A receiving instrument which, in combination with a special aerial system, enables the direction of the transmitting station to be determined.

113. **DISC DISCHARGER, ASYNCHRONOUS**.—A disc discharger the speed of which has no fixed relation to the frequency of the current charging the condenser which it discharges.

114. **DISC DISCHARGER, SYNCHRONOUS**.—A disc discharger usually directly coupled to the alternator supplying power to the condenser. It may discharge the condenser, one, two, three, or more times during a half-period; or every one, two, or more half-periods. The usual practice is to discharge once every half-period, at the moment when the condenser potential is a maximum, and the alternator current zero.

115. **DISRUPTIVE VOLTAGE**.—The voltage required to break down a piece of dielectric between a given pair of electrodes.

116. **DISCHARGER**.—That piece of apparatus in the primary oscillating circuit at which the spark takes place.

117. **DUPLEX TELEGRAPHY**.—Is the transmission of a message and the reception of a message simultaneously at the same station.

118. **DISPLACEMENT CURRENT**.—The electrical condition within a dielectric region of varying electric stress. It produces the same external electric and magnetic effects as the equivalent conduction current.

119. **DYNATRON**.—A three-electrode thermionic tube which depends for its action on the liberation of electrons from the anode by electronic bombardment.

120. **EARTH CONNECTION, OR "EARTH"**.—The connection to the earth which in most systems forms the lower extremity of the Aerial System (q.v.). It usually takes the form of a system of metal plates or wires, or a combination of both, more or less deeply buried in the ground. (U.S. equivalent, Ground.)

121. **EDDY CURRENTS**.—Those induced in conducting masses by external varying magnetic fields, the location of these currents being primarily determined by the position of the fields and not by the configuration of the conducting masses. (That is, the conducting mass is not specially arranged to provide perfectly well-defined circuits.) Such parasitic currents are also called Foucault currents. They can be minimised by using stranded or laminated conductors.

122. **ELECTRIC POTENTIAL** is defined as the work done in carrying a unit charge of electricity from infinity to the point considered. (See Electromotive Force.)

123. **ELECTRIC STRESS**.—The cause of the electrically strained condition in the medium between two regions which are at different potentials.

124. **ELECTROMAGNETIC WAVE**.—A progressive disturbance characterised by the existence on the wave front of electric and magnetic forces acting in directions which are perpendicular to each other and to the direction of propagation of the wave.

125. **ELECTROMOTIVE FORCE**.—The force which tends to displace electricity, and is equal to the difference of potential between the points considered.

126. **ELECTRON**.—The natural unit of negative electricity (4.774×10^{-10} electrostatic units).

127. **ENDODYNE RECEPTION**.—See Autodyne Reception.

128. **ETHER.**—The medium assumed by electromagnetic theory in order to explain the translation of energy at finite speed by electro-magnetic waves.

129. **EXCITATION, IMPULSE.**—A method of producing free alternating currents in an excited circuit in which the duration of the exciting current is short compared with the duration of the excited current.

NOTE.—The condition of short duration implies that there can be no appreciable reaction between the circuits.

130. **FACTOR, DAMPING.**—The product of the logarithmic decrement and the frequency of an exponentially damped alternating current.

Let I_0 = initial amplitude,

I_t = amplitude at the time t ,

e = base of Napierian logarithms (2.718+)

α = damping factor.

Then, $I_t = I_0 e^{-\alpha t}$.

131. **FACTOR, FORM.**—The form factor of a symmetrical antenna for a given wavelength is the ratio of the algebraic average value of the R.M.S. currents measured at all heights to the greatest of these R.M.S. currents.

NOTE 1.—For a given R.M.S. current at the base of the antenna, the field intensity at distant points is proportional to the form factor times the height of the antenna.

NOTE 2.—The effective height (height of centre of capacity) is equal to the form factor times the actual height of the antenna.

NOTE 3.—The limiting values of the form factor for various types of antennas are as follows:

	LINEAR OR VERTICAL ANTENNA	FLAT TOP UMBRELLA ANTENNA
Long Waves	Lower Limit, $1/2$	Upper Limit, 1
Fundamental	Lower Limit, $2/\pi$	

NOTE 4.—The form factor varies in a given antenna at various wavelengths due to variation of the current distribution.

132. **FILAMENT BATTERY OF THERMIONIC VALVE.**—The battery by which the filament is electrically heated to incandescence.

133. **FILAMENT OF THERMIONIC VALVE.**—A thin conductor of metal (usually tungsten in modern valves) or carbon which when rendered incandescent emits electrons.

134. **FORCED ALTERNATING CURRENT.**—One produced in *any* circuit by the application of an alternating electromotive force.

135. **FREE ALTERNATING CURRENT.**—That produced by an isolated electrical displacement in a circuit having capacity, inductance, and less than the critical resistance.

136. **FREQUENCY.**—A term used in connection with any form of rhythmical motion or rhythmical change, denoting the number of complete movements or changes in a given time—usually a second.

137. **FREQUENCIES, AUDIO (ABBREVIATED A.F.).**—The frequencies corresponding to the normally audible vibrations. These are assumed to lie below 10,000 cycles per second.

138. **FREQUENCIES, RADIO (ABBREVIATED R.F.).**—The frequencies higher than those corresponding to the normally audible vibrations, which are generally taken as 10,000 cycles per second. See also Frequencies, Audio.

NOTE.—It is not implied that radiation cannot be secured at lower frequencies, and the distinction from audio frequencies is merely one of definition based on convenience.

139. **FREQUENCY CHANGER.**—See Changer, Frequency.

140. **FREQUENCY, GROUP.**—The number per second of periodic changes of amplitude or frequency of an alternating current.

NOTE 1.—Where there is more than one periodically recurrent change of amplitude, or frequency, there is more than one group frequency present.

NOTE 2.—The term "group frequency" replaces the term "spark frequency."

141. **FREQUENCY METER.**—An instrument which indicates frequency.
 142. **FREQUENCY TRANSFORMER.**—See Changer, Frequency.
 143. **FUNDAMENTAL FREQUENCY.**—The lowest frequency to which an electrical circuit will resonate.
 144. **FUNDAMENTAL OF AN ANTENNA.**—This is the lowest frequency of free oscillations of the unloaded antenna. (No series inductance or capacity.)
 145. **FUNDAMENTAL WAVELENGTH.**—The wavelength corresponding to the lowest free period of any oscillator.
 146. **GAP, MICROMETER.**—A device for protecting any apparatus from excessive potentials, and consisting of a short gap designed for fine adjustment.
 147. **GRID OF THERMIONIC VALVE.**—Is a perforated metal electrode by means of which it is possible (by suitable charging) to disturb the state of the electric field between the filament and the metal anode and so control the value of the thermionic current.
 148. **GRID CIRCUIT OF THERMIONIC VALVE.**—The circuit which includes the space in the valve from grid to filament and the path of the external conductor from filament to grid.
 149. **GRID CONDENSER.**—A partially insulated condenser placed in the grid circuit of a thermionic valve which, on account of the approximately unilateral conductivity of the grid circuit, produces asymmetrical variations of anode current for symmetrical applied grid voltage changes.
 150. **GROUND.**—A conductive connection to the earth.
 151. **GROUP FREQUENCY.**—The number of distinguishable alternating current groups occurring per second in an electrical circuit.
- NOTE 1.**—The group referred to above is, in general, mainly a free alternating current which is substantially damped to extinction before the beginning of the following group or train.
- NOTE 2.**—The pitch of the note in the receiving station is, in general, determined by the group frequency at the transmitting station.
- NOTE 3.**—The term "Group Frequency" replaces the term "Spark Frequency."
152. **HARD VALVE.**—A two or three-electrode valve of extreme exhaustion.
 153. **HARMONIC FREQUENCY.**—The harmonics of any particular frequency are generally understood to be all higher frequencies which are odd, or even multiples of the said frequency. An electrical oscillator which has uniformly distributed inductance and capacity (a straight wire nearly fulfils these conditions) will resonate to any odd or even multiple of its fundamental frequency according to whether one end is earthed or not. If the inductance and capacity are not uniformly distributed the circuit may resonate to a number of frequencies higher than its fundamental, but these higher frequencies will not necessarily bear any whole multiple relation to the fundamental frequency.
 154. **HEIGHT, EFFECTIVE, OF AN ANTENNA.**—See Factor, Form ; Note 2.
 155. **HETERODYNE.**—A receiver for continuous waves using the principle of reaction between locally generated oscillations and the received oscillations in order to produce beats.
 156. **HETERODYNE WAVEMETER.**—A valve oscillator the oscillatory circuit of which is calibrated in wavelengths. Syntony between the calibrated and experimental circuits is obtained by tuning until no beats are heard.
 157. **HIGH-FREQUENCY RESISTANCE.**—The resistance offered by a conductor to the passage of high-frequency currents.

It is always greater than the resistance for direct current because of the unequal current distribution over a section of the conductor when carrying high-frequency currents.

158. **HIGH-TENSION BATTERY.**—The battery used in the anode circuit of a thermionic valve.

159. **HYSTERESIS.**—A property of a substance or body by virtue of which an effect produced in a body by changing conditions lags behind the conditions. In the case of iron carried through a magnetic cycle, the magnetisation lags behind the magnetising force.

160. **IMPEDANCE.**—Total opposition to current flow in a circuit in which the current is varying, and is numerically equal to the square root of the sum of the squares of the ohmic resistance and the total reactance of the circuit.

161. **IMPULSE EXCITATION.**—See Excitation, Impulse.

162. **INDUCTANCE.**—That property of a material system by virtue of which it is capable of storing energy electromagnetically.

The inductance of a system is dependent upon its geometrical dimensions and the permeability of the surrounding media. In hysteresis-free circuits inductance is measured by the ratio of the energy stored in the magnetic field surrounding a current-carrying conductor to the square of the current in that conductor, for stationary conditions. In any circuit, it may be measured by the interlinkage with the system itself of magnetic lines of force due to unit current passing through the system. An alternative method involves the measurement of the counter-electromotive force at the terminals of the given conductor when the current through the conductor changes at the rate of one ampere of current per second. In hysteresis-free circuits these three methods of measurement yield identical results.

163. **INDUCTANCE, EFFECTIVE, OF AN ANTENNA.**—See Capacity, Effective, of an Antenna.

164. **INDUCTION COIL.**—A piece of apparatus which makes use of the phenomena of induction to transform an intermittent current of comparatively low voltage to an alternating current of high voltage.

165. **INDUCTIVE COUPLING.**—Two circuits so arranged that some of the magnetic flux of force from one passing through the other circuit are inductively coupled.

166. **INTERFERENCE.**—The interaction of two alternating currents or of electromagnetic waves under conditions such that they oppose each other.

167. **INTERFERENCE (IN RECEPTION).**—The introduction of undesired signals, either from other stations or from Atmospherics (q.v.), into a receiver which is engaged in the reception of a message; often referred to as "jamming."

168. **INTERFERENCE, WAVE (IN RADIO COMMUNICATION).**—The reinforcement or neutralisation of waves arriving at a receiving point along different paths from a given sending station (to be distinguished from ordinary or ordinary interference, which is the simultaneous reception of signals from two or more stations).

169. **IONISATION OF A GAS.**—The breaking away from the molecules of ions contained in them, thus rendering the gas conductive.

Ionisation in gases may be brought about by various ionising agents—X-rays, ultra-violet light, or high-speed electrons.

170. **IONISATION BY COLLISION.**—The liberation of electrons from the atoms of a gas due to the collisions between the atoms and high-speed electrons.

171. **JAMMING.**—See Interference (in Reception).

172. **JIGGER.**—The transformer used in coupled circuits. The primary and secondary form part of the primary and secondary circuits respectively. The transformer has part of the winding common to both primary and secondary, it is called an Auto-Jigger.

173. **KALLIROTRON.**—A form of aperiodic retroactive amplifier consisting of two thermionic valves so connected by pure resistances that a rise of grid potential of either produces a fall of grid potential of the other. The ampli-

cation obtained exceeds the amplification factor of either valve by any desired amount according to the extent of the retroaction.

174. KATHODE.—“(a) In an electrolytic cell. The conductor through the surface of which the current leaves the electrolyte.

“(b) In a primary cell. The conductor (generally carbon) through which the current leaves the electrolyte.

“(c) The electrode by which the current leaves a cell or other apparatus, such as a vacuum tube or thermionic valve.”

175. KEY (MANIPULATING) (OPERATING).—A switch arranged for easy manual operation.

176. KEY, RELAY.—See Relay Key.

177. LENGTH, WAVE.—See Wavelength.

178. LINE OF FORCE.—A curve described in an electric or magnetic field such that the direction of the electric or magnetic force at any point of that curve is a tangent to the curve.

179. LOADING COIL.—A coil possessing self-inductance inserted in an aerial circuit to increase the natural wavelength of the circuit.

180. LOSSES, BRUSH OR CORONA.—See Brush or Corona Losses.

181. LOW-TENSION BATTERY.—See Filament Battery.

182. MAGNETIC FIELD INTENSITY.—The number of lines of force per unit area.

183. MAGNETIC FORCE.—At a point. The force acting on a unit magnetic pole placed at that point. It is numerically equal to the field intensity in a medium of unit permeability.

184. MAGNETIC HYSTERESIS.—That property of a magnetic medium which is measured by the energy losses when the rising and falling (magnetomotive force—induction), *i.e.* (H—B), dynamic characteristics are not identical.

185. MAGNETOMOTIVE FORCE.—A force tending to produce a magnetic flux.

186. MAGNETIC DETECTOR (MARCONI'S).—A detector of oscillations depending on the effect on the hysteresis of iron.

187. MICROPHONE.—A variable resistance, usually in the form of an electrical contact, whose resistance is varied with and in a proportional manner to the movement or pressure of one part. Thus if the movement or pressure is produced by sound waves acting on a diaphragm which is connected to the moving member of the microphone, an electrical current will be produced in the circuit containing the microphone and a battery, whose amplitude varies in a similar manner to the movement of the diaphragm.

188. MUTUAL CONDUCTANCE of a thermionic valve is given by the slope of the grid voltage—anode current characteristic at any operating point.

189. MUTUAL INDUCTANCE of two circuits is the mutual potential energy of the circuits when unit current is flowing in each.

190. NATURAL FREQUENCY.—Is the frequency with which a circuit will oscillate when supplied with energy and then left to itself. If

R = resistance

L = inductance

C = capacity

N = frequency per second

$$\text{then } N = \frac{1}{2\pi} \sqrt{\frac{1}{LC} \frac{R^2}{4L^2}}$$

191. NATURAL FREQUENCY OF ANTENNA.—See Capacity, Effective, of an Antenna.

192. **NOTE OR TONE TUNING.**—A receiver is tuned to the note of the transmitter when a circuit or part of the indicator is designed to resonate to the spark frequency.

193. **OSCILLATING VALVE.**—A thermionic valve in a circuit which is electrically unstable and generating continuous oscillations.

194. **OSCILLATIONS.**—See Alternating Currents, Free and Forced, also Current, Damped Alternating.

195. **OSCILLATOR, ARC.**—See Arc Oscillator.

196. **OSCILLOGRAPH.**—"An apparatus for observing or recording quickly varying currents or potential differences" (B.E.C.).

197. **PERIOD, PERIODIC TIME.**—"Any varying quantity which repeats its values regularly at equal time intervals is said to be periodic, and the time-interval of one repetition is called the periodic time or period" (B.E.C.).

198. **PERMEABILITY of a medium.**—The ratio of the magnetic flux density produced in that medium by a given magnetomotive force to the magnetic flux density produced by the same magnetomotive force in vacuum (or, for practical purposes, in air).

199. **PHASE.**—" (a) In an operation which recurs periodically the stage or state to which the operation has proceeded.

" (b) In an operation which recurs periodically the fraction of the whole period which has elapsed, measured from some fixed origin" (B.E.C.).

200. **PHASE DIFFERENCE.**—"The difference of phase (usually reckoned in time or in angle) between two periodic quantities which vary harmonically. Each of the circuits of a polyphase apparatus is sometimes called a phase" (B.E.C.).

201. **PLAIN AERIAL.**—An early form of transmitter in which the spark gap was placed directly in series with aerial and earth, so that the only condenser in which the energy of the transmitter could be stored was the capacity of the aerial to earth.

The term is also applied to the receiving circuit when the detector is placed directly in series with the receiving aerial and earth.

202. **PLATE.**—See Anode.

203. **PLATE CIRCUIT.**—Is the circuit in a thermionic valve which includes the space in the valve from plate to filament and the path through the external conductors from filament to plate.

204. **PLIODYNATRON.**—A combination of a pliotron and a dynatron, being a four-electrode thermionic tube. The output is controlled by the control grid which is between the filament and the heavier grid-anode.

205. **PLIOTRON.**—A three-electrode valve of extreme exhaustion.

206. **POLARISATION of a wave.**—A wave is said to be plane polarised when its electric and magnetic displacements are confined to two fixed planes at right angles.

When the plane of the electric and magnetic displacement rotates uniformly with time, the waves are said to be circularly or elliptically polarised.

Such waves result from the compounding of two plane polarised waves having the same frequency and line of propagation but different relative phases and polarised in different planes.

207. **POTENTIOMETER.**—An instrument for adjusting at will the potential between any two parts of a circuit.

An instrument for measuring potential difference.

208. **POTENTIAL.**—See Electrical Potential.

209. **POWER.**—The amount of work done in unit time.

210. **POWER, APPARENT.**—In an alternating electric circuit this is the product volts \times amperes.

211. POWER FACTOR.—"The ratio of the watts to the voltamp res. In the case of voltage and current of sine form the power factor is $\cos \phi$ "

(B.E.C.). In an oscillating circuit $\cos \phi = \frac{\delta}{\pi}$ where δ is the decrement.

212. QUENCHED SPARK.—A spark whose duration is shortened by conditions at the discharger designed to increase rapidly the resistance at the spark gap is said to be "quenched."

213. RADIATION RESISTANCE.—The resistance which multiplied by the square of the R.M.S. current in the aerial equals the energy lost by the aerial in radiation.

214. RADIATION, SUSTAINED.—See Waves, Sustained.

215. RADIOGRAM.—A telegram sent by radio.

216. TO RADIOGRAPH (VERB).—To send a radiogram.

217. RADIOTELEPHONE.—An apparatus for the transmission of speech by radio.

218. RADIO PHONE (NOUN).—A telephone message sent by radio.

219. TO RADIOPHONE (VERB).—To send a radiophone.

220. REACTANCE of a circuit is a function of the inductance, capacity, and the impressed frequency.

An inductance has reactance $2 \pi \times \text{frequency} \times \text{inductance}$.

A capacity has reactance

I

$$\frac{1}{2 \pi \times \text{frequency} \times \text{capacity}}$$

An inductance in series with a capacity has reactance equal to the sum of the reactance of the inductance and the reactance of the condenser.

Under conditions of resonance in a circuit the reactance of the capacity neutralises the reactance of the inductance and the resulting reactance is zero.

221. RECTIFIER.—An apparatus for converting alternating or oscillating currents into continuous current, or into pulses of unidirectional current.

RECTIFIER, ELECTRON.—A device for rectifying an alternating current by utilising the approximately unilateral conductivity between a hot cathode and a relatively cold anode in so high a vacuum that a pure electron current flows between the electrodes. See also Kenetron.

222. RECTIFIER, GAS.—An electron rectifier containing gas which modifies the internal action by the retardation of the electrons or the ionisation of the gas atoms.

223. REFLECTION OF ELECTROMAGNETIC WAVES.—(1) When a wave reaches the interface between two media of different dielectric constants its energy does not wholly pass from one medium to the other, but in part remains in the first medium in a reflected wave which travels back from the interface. When the dimensions of the separating surface are large compared with the wavelength the laws of reflection of electromagnetic waves are in general the same as for light.

(2) When waves are being guided by a conductor, such as a wire which has a certain inductance and capacity per unit length, any abrupt change in the value of these constants (such as are produced by inserting an inductance coil, or occur at the end of the wire) causes the production of alternating potentials which result in a wave which travels along the wire in the opposite direction. This second wave is also called a reflected wave.

224. REFRACTION.—The change in the direction of a wave propagation when passing from one medium to another.

225. REGENERATIVE OR RETROACTIVE AMPLIFICATION.—Amplification obtained in a thermionic valve by causing the energy variations of the anode circuit to feed back into the grid circuit and thus increase the voltage operating on the grid.

226. RELAY.—An apparatus by means of which a current, too small to perform a required work, is made to control a larger and adequate current.

227. RELAY, ELECTRON.—A device provided with means for modifying the pure electron current flowing between a hot cathode and a relatively cold anode placed in as nearly as possible a perfect vacuum.

These means may be, for example, an electric control of the pure electron current by variation of the potential of a grid interposed between the cathode and the anode.

228. RELAY, Gas.—An electron relay containing gas which modifies the internal action by the retardation of the electrons or the ionisation of the gas atoms.

229. RELAY KEY.—An electrically operated key. See further, Key.

230. RESISTANCE.—The measure of that property of a conductor by the action of which electrical energy is transformed into heat in that conductor. It is numerically equal to the ratio of the heat energy liberated per second, measured in watts, to the square of the current in the circuit, for stationary conditions; it is also equal to the ratio of the applied electromotive force to the resulting current, both being constant.

231. RESISTANCE, ANTENNA.—See Antenna Resistance.

232. RESISTANCE, CRITICAL, OF A CIRCUIT.—That resistance which determines the limiting condition at which the oscillatory discharge of a circuit passes into an aperiodic discharge.

233. RESISTANCE, EFFECTIVE, OF A SPARK.—The ratio of the power dissipated by the spark to the mean square current.

234. RESISTANCE, RADIATION.—This is the ratio of the total energy radiated (per second) by the antenna to the square of the R.M.S. current at a potential node (generally the ground connection). See further, Antenna, Resistance.

235. RESISTANCE, RADIO FREQUENCY.—This is the ratio of the heat produced per second in watts to the square of the R.M.S. current (R.F.) in amperes in a conductor.

236. RESONANCE.—Resonance of a circuit to a given exciting alternating E.M.F. is that condition due to variation of the inductance or capacity in which the resulting effective current (or voltage) in that circuit is a maximum.

NOTE 1.—Instead of varying the inductance and capacity of a circuit the frequency of the exciting field may be varied. The condition of resonance is determined by the frequency at which the current (or voltage) is a maximum.

NOTE 2.—The resonance frequency corresponds the more accurately to the frequency of the free oscillations of a circuit, the lower the damping of the exciting alternating field and of the excited circuit.

A circuit will resonate to an impressed frequency when the reciprocal of 2π times the square root of the product of inductance and capacity is equal to the impressed frequency and provided that its resistance is less than the critical resistance. Under conditions of resonance the amplitudes of successive half-periods of the resultant current gradually increase to a maximum which is dependent only on the impressed electromotive force and the resistance of the circuit, including radiation.

237. RESONANCE, ACOUSTIC DEVICE.—See Device, Acoustic Resonance.

238. RESONANCE CURVE.—A curve showing the relation between the current or voltage induced in an oscillatory circuit and the inducing frequency.

239. RESONANCE, SHARPNESS OF.—See Tuning, Sharpness of.

240. RETROACTIVE AMPLIFICATION.—See Regenerative Amplification.

241. ROOT-MEAN-SQUARE VALUE.—R.M.S. value of an alternating or oscillating current or voltage is the value given by the square root of the mean of the squares of the successive values throughout the half-period.

In a current or voltage of strict sine-wave form (sinusoidal) the R.M.S. value is equal to the maximum multiplied by $\frac{1}{\sqrt{2}}$ —i.e., $(1/\sqrt{2})$. The R.M. value is also called the effective or virtual value.

242. **SELECTIVITY.**—The power of a receiving system to discriminate between a number of simultaneous signals.

243. **SELF-INDUCTANCE** of a circuit.—That portion of the inductance which is due to the magnetic field produced by the current in that circuit. See also Inductance.

244. **SHARPNESS OF TUNING.**—The measure of the rate of diminution of current in transmitters and receivers with detuning of the circuit which is varied.

If d_1 is the decrement of the free alternating current in the circuit and d_2 the decrement of the exciting E.M.F., then the sharpness of tuning is arbitrarily defined as $\frac{\pi}{d_1 + d_2}$.

In the case of continuous oscillations this reduces to $\frac{\pi}{d_2}$.

245. **SHEATH.**—The anode or plate of a thermionic valve.

246. **SHOCK EXCITATION.**—A name given to the method of exciting oscillations in the aerial circuit by a sudden and very short transference of energy from another circuit.

247. **SHORTENING CONDENSER.**—A condenser inserted in series with an aerial circuit to decrease the natural wavelength of the circuit.

248. **SKIN EFFECT OF VARYING CURRENTS.**—The non-uniform current density through the cross-section of the conductor. It is greatest at the surface and least at the centre.

249. **SOFT VALVE.**—A two or three-electrode valve containing an appreciable amount of gas.

250. **SPACE CHARGE.**—The electric charge possessed by the electrons or positive ions situated in the vacuous space between the electrodes of a discharge tube or thermionic valve.

251. **SPARK.**—An electrical discharge across a gap. It may consist of one discharge in either direction, but generally consists of a number of rapid oscillatory discharges.

252. **SPECIFIC INDUCTIVE CAPACITY.**—See Dielectric Constant.

253. **STATIC.**—Disturbances caused by atmospheric charging of the antenna.

NOTE.—When it is definitely known that disturbances are due to atmospheric charging of the antenna, the word "Static" is used. In general, disturbances are called "Strays."

254. **STRAYS.**—Electromagnetic disturbances set up by distant charges.

255. **SYNTONY AND SYNTONISATION.**—The adjustment of one circuit to another, or of one transmitter taken as a whole to one receiver taken as a whole, in such a way that their time-periods are the same and waves of a different time-period produce little or no effect on the system.

256. **TELEGRAPHY, RADIO.**—The art of sending and receiving radiograms.

257. **TELEPHONY, RADIO.**—The art of sending and receiving radiophones.

258. **THERMIONIC CURRENT.**—The current passing through a vacuous space and consisting of electrons or ions emitted by an incandescent electrode.

259. **THERMIONIC VALVE.**—A vacuum tube with incandescent filament and auxiliary electrodes which may function as an amplifier, detector or generator of electrical oscillations.

260. **TICKER, TIKKER.**—A rapid make-and-break device used in conjunction with a resonant circuit and a pair of telephones as a receiver for

continuous waves. It discharges the condenser of the resonant circuit at every make. The speed of the make-and-break device has no relation to the wave frequency.

261. **TONE WHEEL.**—A high-speed commutator used as a receiver for continuous waves. It is run at a speed slightly different from the synchronous speed for the wave frequency and in effect converts the high-frequency current into a current of audible frequency.

262. **TRAIN OF WAVES.**—The waves produced by one discharge of the primary condenser in a spark circuit.

263. **TRANSFORMER.**—A stationary induction apparatus for transferring energy from one circuit to another by the medium of magnetic energy.

It may or may not transform the current into another current at different potential. In present radio practice the term should be restricted to audio frequency transformers. See Frequency, Audio.

264. **TRANSMISSION, DIPLEX.**—See Diplex Transmission.

265. **TUNER.**—An apparatus made in a convenient form, which in conjunction with a detector provides all necessary circuits and adjustments for selective tuning.

266. **TUNING.**—The process of securing the maximum indication by adjusting the time period of a driven element. See Resonance.

267. **TUNING, SHARPNESS OF.**—See Sharpness of Tuning.

268. **UNDAMPED WAVES.**—See Continuous Waves.

269. **VACUUM TUBE, THREE ELECTRODE.**—As examples see Relays, Electron and Gas.

270. **VACUUM TUBE, TWO ELECTRODE.**—As examples see Rectifiers, Electron and Gas.

271. **VALVE, FLEMING.**—A detector for oscillations. It depends on the rectifying properties of the ionised space between a hot filament and a cold electrode in an exhausted vessel.

272. **VALVE, THERMIONIC.**—See Thermionic Valve.

273. **WAVES, ELECTROMAGNETIC.**—A periodic electromagnetic disturbance progressive through space.

274. **WAVELENGTH.**—Twice the distance (taken in the line of propagation of the wave) between two successive points of zero disturbance; or the distance between two consecutive maxima, of the same sign. The wavelength is numerically equal to the velocity of the waves divided by the frequency.

275. **WAVELENGTH (OF AN ELECTROMAGNETIC WAVE).**—The distance in metres between two consecutive maxima of the same sign. The wavelength is numerically equal to the velocity of the waves (3×10^{10} cms. per second) divided by their frequency.

276. **WAVELENGTH, FUNDAMENTAL.**—See Fundamental Wavelength.

277. **WAVELENGTH, NATURAL.**—In a loaded antenna (that is, with series inductance or capacity) the natural wavelength corresponds to the slowest free oscillation.

278. **WAVE CHANGER.**—See Changer, Wave.

279. **WAVEMETER.**—A radio frequency measuring instrument calibrated to read wavelengths.

280. **WAVES SUSTAINED.**—Waves radiated from a conductor in which an alternating current flows.

281. **WAVE TRAIN.**—See Train of Waves.

282. **WING CIRCUIT.**—See Anode Circuit.

(B) Foreign Equivalents.

ENGLISH.	FRENCH.	ITALIAN.	SPANISH.	GERMAN.
Accumulator batteries	Batterie d'accumulateurs	Batterie di accumulatori	Acumuladores, Baterias de	Accumulatoren Batterie
Aerial, balancing	Antenne de compensation	Antenna di compensazione	Antena compensadora	Wage Antenne
Aerial, directional	Antenne dirigée	Antenna dirigibile	Antena dirigida	Gerichtete Antenne
Aerial, direction finder	Antenne réception dirigée	Antenna, rivelatrice della direzione	Antena para busca de direcciones	Antenne, zur Entdeckung der Richtung
Aerial, horizontal	Antenne horizontale	Antenna orizzontale	Antena horizontal	Horizontaler Luftleiter
Aerial, receiving	Antenne de réception	Antenna di ricezione	Antena de recepcion	Empfangsdraht
Aerial, transmitting	Antenne d'émission	Antenna di trasmissione	Antena de transmission	Gebirah (Sendeluftleiter)
Aerial, umbrella	Antenne en parapluie	Antenna a forma di ombrella	Antena de paragua en forma	Schirmnetz
Alternator	Alternateur	Alternatore	Alternador	Wechselstrom Generator
Alternator, high-frequency	Alternateur à haute fréquence	Alternatore ad alta frequenza	Alternador de alta frecuencia	Hochfrequenz Generator
Ammeter, a.c.	Ampermètre pour courant alternatif	Amperometro per corrente alternata	Amperímetro, c.a.	Wechse stromamperemeter
Ammeter, d.c.	Ampermètre pour courant continu	Amperometro per corrente continua	Amperímetro, c.c.	Gleichstromamperemeter
Ammeter, hotwire	Ampermètre à fil chaud	Amperometro a filo caldo	Amperímetro térmico	Hitzdrahtamperemeter
Ammeter, moving coil	Ampermètre d'Arsonval	Amperometro a bobina mobile	Amperímetro de bobina móvil	D'Arsonval'scher Amperemeter
Amplifier, thermionic	Amplificateur à lampes	Divisorio di angoli	Divisor de Angulo	Vakuum-röhren Verstärker
Angle divider	Diviseur d'angle	Anodica	—	Winkel Trennungs-Apparat
Anode	Anode	Antenna	Antena	Anod
Antenna	Antenne	Fili orizzontali dell'antenna	Antena, Prolongación horizontal de la	Luftleiter (Antenne)
Antenna, horizontal extension of	Branch horizontale de l'antenne	Antenna a forma di T	Antena en forma de T	Horizontale Verlängerungsdrähte des Luftleiters
Antenna, T-shaped	Antenne en T	Antenna a forma di T allungata	Antena en forma de T prolongada	T. formige Antenne
Antenna, extended T-shaped	Antenne en T, à branches horizontales prolongées	Apparecchi di ricezione	Aparatos receptores	Verlängerte T. Luftleiter
Apparatus, receiving	Appareils de réception	Apparecchi di trasmissione	Aparatos transmisores	Empfänger
Apparatus, transmitting	Appareils de transmission	—	—	Sender
Arrester, earth terminal	Eclateur de mise à terre	Morsetto per presa di terra	Espacio de chispa de tierra	Unterbrochener Erdschluss
Arrester, lightning	Parafoudre	Dispositivo scaricafulmine	Pararrayos	Blitzschutz
Atmospheres	Perturbations atmosphériques	Perturbazioni atmosferiche	Perturbaciones atmosféricas	Luftstörungen
Audio frequency	Haute fréquence	Alta frecuencia	Alta frecuencia	Hochfrequenz

Battery of Leyden jars	Batterie de bouteilles de Leyde	Batteria di bottiglie di Leyda	Bateria de Botellas de Leyden	Batterie Leydener Flaschen
Beats (Heterodyne)	Sons de battements	Campanello di chiamata	Timbre de llamada	Iockklingel
Bell, call-	Sonnerie d'appel	Ventilatore ad azionamento elettrico	Motor soprador or Ventilador electrico	Geblaese, mit Elektrischen Antrieb
Blower, electric motor	Soufflerie à moteur électrique	Barre collettrici principali	Barras colectoras principales	Haupt Sammelschienen
Busbars, main-	Barres omnibus principales	Fabbricato della stazione	Edificio de la estación	Stationhaus
Building, station-	Bâtiment du poste radio-télégraphique	Vibratore	Zumbador	Summer
Buzzer	Vibrateur	Cicala per la pratica della ricezione a udito	Zumbador para prácti	Übungssummer
Buzzer, practice	Vibrateur d'apprentissage			
Capacity	Capacité	Capacità	Capacidad	Aufnahmefähigkeit
Capacity earth	Contrepoids	Capacità di terra	Capacidad de tierra	Gegengewicht
Cart, radiotelegraph	Voiture radiotélégraphique	Carro radiotelegrafico	Carro de radiotelegrafia	Funkenkarren
Cathode, incandescent	Cathode incandescente	Catodo incandescente	Cátodo incandescente	Glimmende Kathode
Change of connections for receiving	Commutation pour la réception	Commutazione per ricezione	Cambio de conexiones para la recepción	Umschaltung auf Empfangen
Change of connections for transmitting	Commutation pour la transmission	Commutazione per trasmissione	Cambio de conexiones para la transmisión	Umschaltung auf Senden
Chokes, air core protecting	Bobine de réactance sans noyau de fer	Bobine di protezione a nucleo d'aria	Bobinas de reactancia, de aire	Impedanzspulen für hohe Frequenz mit Luftkern
Choking coil	Bobine d'impédance	Rocchetto d'autoinduzione	Bobina de reactancia	Drosselspule
Circuit breaker and closer	Disjoncteur et conjointeur automatique	Interruttore	Interruptor con apertura y cierre automáticos	Strom - unterbrecher und Strom-schliesser
Circuit, closed oscillating	Circuit oscillant fermé	Circuito oscillante chiuso	Circuito oscilante cerrado	Geschlossener Erregerkreis
Circuit, intermediate	Circuit intermédiaire	Circuito intermedio	Circuito intermedio	Zwischenkreis
Circuit, open radiating	Circuit radiant ouvert	Circuito radiante aperto	Circuito radiador abierto	Offener Strahlungskreis
Circuit, oscillatory	Circuit oscillatoire	Circuito oscillante	Circuito oscilante	Schwingungskreis
Coherer	Coherer	Ricevitore a coherer	Cohesor	Fritterempfangler
Coil, syntonising	Inductance de syntonisation	Rocchetto di syntonizzazione	Bobina de syntonización	Abstimmspule
Commutator	Commutateur	Commutatore	Commutador	Stromwender
Commutator (of Dynamo)	Collecteur	Collettore	Colector	Stromwender
Condensers	Condensateurs	Condensatori	Condensadores	Kondensatoren
Condenser, adjustable	Condensateur réglable	Condensatore regolabile	Condensador variable	Variabler Kondensator
Condenser, adjustable disc	Condensateur à disque	Condensatore a disco regolabile	Condensador de disco, variable	Drehkondensator
Condenser, aerial tuning	Condensateur de syntonisation d'antenne	Condensatore per la syntonizzazione dell' antenna	Condensador de syntonización de la antena	Kondensator zur Luftleiterabstimmung

ENGLISH.	FRENCH.	ITALIAN.	SPANISH.	GERMAN.
Condenser, air . . .	Condensateur à air . . .	Condensatore ad aria . . .	Condensador de dialéctrico de aire . . .	Luftkondensator
Condenser, calibration . . .	Condensateur étalon . . .	Condensatore per taratura . . .	Condensador para calibración . . .	Eichungskondensator
Condenser, circuit . . .	Circuit du condensateur . . .	Circuito del condensatore . . .	Condensador, Circuito de . . .	Kondensatorkreis
Condenser, intermediate circuit . . .	Condensateur du circuit intermédiaire . . .	Condensatore per il circuito intermedio . . .	Condensador del circuito intermedio . . .	Kondensator im Zwischenkreis
Condenser, secondary circuit . . .	Condensateur du circuit secondaire . . .	Condensatore per il circuito secondario . . .	Condensador del circuito secundario . . .	Kondensator im Sekundärkreis
Condenser, short wave . . .	Condensateur de raccourcissement . . .	Condensatore per onda corta . . .	Condensador de onda corta . . .	Verkürzungskondensator
Condenser-system . . .	Système de condensateur . . .	Sistema di condensatori . . .	Sistema de Condensadores . . .	Kondensatorsystem
Condensers, test-tube . . .	Condensateurs à tube . . .	Condensatori tubolari . . .	Tubo para ensayo de condensadores . . .	Kondensator Prüfröhre
Condenser, twin-coupled . . .	Condensateur jumelé . . .	Condensatore a doppio accoppiamento . . .	Condensador de doble acoplamiento . . .	Kondensator, doppelt geschaltete
Condensers, variable . . .	Condensateurs réglables . . .	Condensatori variabili . . .	Condensadores variables . . .	Variablerkondensatoren
Converter . . .	Commutatrice . . .	Convertitore . . .	Convertidor . . .	Drehumformer
Continuous wave . . .	Onde entretenue . . .	Onda continua . . .	Onda continua . . .	Kontinuierliche Welle
Continuous wave receiver . . .	Recepteur pour ondes entretenues . . .	Ricevitore d'onde non smorzata . . .	Receptor para onda continua . . .	Empfänger fuer kontinuierliche Welle
Coupling . . .	Couplage . . .	Accoppiamento . . .	Acoplamiento . . .	Kopplung
Couplings, flexible and insulating . . .	Manchons d'accouplement souples et isolants . . .	Accoppiamenti elastici ed isolanti . . .	Acoplamientos flexibles y aisladores . . .	Biegsame und isolierende Verbindungen
Current, alternating . . .	Courant alternatif . . .	Corrente alternata . . .	Corriente alterna . . .	Wechselstrom
Current, direct . . .	Courant continu . . .	Corrente continua . . .	Corriente continua . . .	Gleichstrom
Current, primary alternating . . .	Courant alternatif primaire . . .	Corrente alternata del circuito primario . . .	Corriente alterna primaria . . .	Primär Wechselstrom
Cut-out, automatic . . .	Interrupteur automatique . . .	Interruttore automatico . . .	Interruptor automático . . .	Selbstunterbrecher
Cymometers . . .	Cymomètres . . .	Cimometri . . .	Cinómetro . . .	Wellenmesser
Damper . . .	Sourdine . . .	Sordina . . .	Amortiguador . . .	Dämpfer
Damping, high . . .	Amortissement élevé . . .	Forte smorzamento . . .	Amortiguamiento, Gran . . .	Grosse Dämpfung
Dekrometer . . .	Décrimètre . . .	Décrimetro . . .	Décrimetro . . .	Dekrometer (Dampfungs-)
Detector, crystal . . .	Détecteur à cristal . . .	Rivelatore di onde a cristallo . . .	Detector de cristal . . .	Kristalldetektor
Detector, magnetic . . .	Détecteur "Fleming" . . .	valvola di Fleming . . .	Fleming . . .	Empfänger
Detector, magnetic . . .	Détecteur magnétique . . .	Rivelatore di onde magnetica . . .	Detector magnético . . .	Marconi-Magnetdetektor

Discharger, asynchronous.	Eclateur asynchrone .	Scaricatore asincrono .	Descargador asincrono .	Scheibenfunkenstrecke, asynchron
Discharger, disc, high-speed	Eclateur à disque à grand-vitesse	Scaricatore a disco ad alta velocità	Descargador de disco de gran velocidad	Schnell rotierende Scheibenfunkenstrecke
Discharger, disc, smooth .	Eclateur à disque uni .	Scaricatore a disco a con-torni lisci	Descargador de discoliso	Rotierende Scheibenfunkenstrecke-glatt
Discharger, disc, studded .	Eclateur à disque—muni de prisonniers latéraux	Scaricatore a disco con punte	Descargador de disco dentado	Rotierende Scheibenfunkenstrecke mit Zähne
Discharger, fixed .	Eclateur fixe	Scaricatore fisso .	Descargado fijo .	Scheibenfunkenstrecke, fixierter
Discharger, micrometric spark	Eclateur à étincelle micrométrique	Scaricatore per la produzione di scintilla micrometrica	Descargador de chispa micrométrica	Mikrometerfunkenstrecke
Discharger, side electrodes	Eclateur à électrodes latérales	Scaricatore con elettrodi laterali	Descargador, electrodos laterales del	Scheibenfunkenstrecke, Seiten electrodeen
Discharger, synchronous .	Eclateur synchrone	Scaricatore sincrono .	Descargador sincrono .	Scheibenfunkenstrecke, synchron
Duplex telegraphy .	Télégraphe duplex .	Telegrafia duplex .	Telegrafia duplex .	Duplex Telegraphie
Earth connection .	Connexion de terre	Messa a terra .	Conexión de tierra .	Erd Verbindung
Efficiency .	Rendement	Rendimento .	Rendimiento .	Wirkungsgrad
Electromagnetic coupling	Couplage électromagnétique	Accoppiamento elettromagnético	Acoplamiento electromagnético	Electromagnetische Kopplung
Electron emission .	Emission d'électrodes	Emissione elettronica .	Emisión de electrones .	Electronenemission
Electrostatic coupling	Couplage électrostatique	Accoppiamento elettrostatico	Acoplamiento electrostatico	Electrostatiche Kopplung
Filament battery .	Batterie des filaments	Batteria d'accensione dei filamenti	Bateria de filamento	Heizbatterie
Frequency, high .	Haute fréquence	Alta frecuencia .	Frecuencia, alta .	Hochfrequenz
Frequency, low .	Basse fréquence	Bassa frecuencia .	Frecuencia, baja .	Niedfrequenz
Frequency meter .	Fréquencemètre	Frequenziometro .	Frecuencimetro .	Frequenzmesser
Generating plant	Générateur	Impianto generatore	Instalación generadora .	Stromanlage
Generator, c.c.	Dynamo .	Generatore di corrente continua	Generador de corriente continua	Dynamo (Gleichstrom)
Grid .	Grille .	Griglia .	Rejilla .	Gitter

ENGLISH.	FRENCH.	ITALIAN.	SPANISH.	GERMAN.
Grid circuit	Circuit de grille	Circuito di griglia	Circuito de rejilla	Gitter Kreis
Grid leak	Shunt de grille	Circuito di dispersione di griglia	Derivación de rejilla	Gitter Ableitung
Group frequency	Fréquence des trains d'ondes	Frequenza delle scintille	Frecuencia de tren	Gruppen frequenz
Hammer-break, magnetic	Interrupteur à marteau	Interruttore magnetico a martello	Interruptor magnético de martillo	Magnetischer Hammerunterbrecher
Heterodyne	Hétérodyne	—	—	Heterodyn
Heterodyne receiver	Hétérodyne	Ricevitore a eterodina	Receptor heterodino	Überlagerungs Empfänger
Impedance	Impédance	Impedenza	Impedancia	Scheinbarer Widerstand
Inductance, aerial	Inductance d'antenne	Induttanza dell' antenna	Induttancia de antena	Antenneninduktanz
Inductance, aerial tuning	Inductance à synchroniser le circuit de l'antenne	Induttanza per la sintonizzazione dell' antenna	Induttancia de sintonización de la antena	Induktanz zum Synchronisieren der Antenne
Inductance, low frequency	Bobine d'inductance du circuit à basse fréquence	Induttanza per il circuito a bassa frequenza	Induttancia del circuito de baja frecuencia	Induktanzspule niedriger Frequenz
Inductance, primary	Inductance primaire	Induttanza per circuito primario	Induttancia primaria	Primärinduktanz
Inductance, primary synchronising	Inductance primaire de synchronisation	Induttanza sintonizzatrice del circuito primario	Induttancia primaria de sintonización	Primärinduktanz zum Abstimmen
Inductance, variable primary synchronising	Inductance primaire variable de synchronisation	Induttanza sintonizzatrice del circuito primario, regolabile	Induttancia variable de sintonización del primario	Veränderliche Primärinduktanz zum Abstimmen
Induction coil	Bobine d'induction	Rocchetto d'induzione	Bobina de inducción	Rhunkorffscher Funkeninduktor
Inkwriter, Morse	Appareil Morse enregistreur	Ricevitore scrivente Morse	Aparto Morse registrador	Schreibempfänger
Insulation	Isolation	Isolamento	Aslamiento	Isolierung
Insulation resistance	Résistance d'isolation	Resistenza d'isolamento	Resistencia de aislamiento	Isolation Widerstand
Insulator, leading-in	Isolateur d'entrée	Isolatore d'entrata	Aslador de entrada	Isolator, Einführungs
Insulator, flexible	Isolateur souple	Isolatore elastico	Aslador flexible	Flexibler Isolator
Insulator, receiving	Isolateur de réception	Isolatore dell' antenna di ricezione	Aslador para circuito receptor	Isolator für den Empfänger
Interrupter, electrolytic	Rupteur électrolytique	Interruttore elettrolitico	Interruptor electrolítico	Quecksilberturbine
Interrupter, turbine	Turborupteur à mercure	Interruttore a turbina	Interruptor de turbina	Weltweit Unterbrecher

Jigger, balanced	Jigger compensé	Trasformatore ad alta frequenza compensato	Jigger compensador	Jigger, bilanziato
Jigger, primary	Primaire de transformateur d'oscillation	Circuito primario del trasformatore delle correnti oscillatorie	"Jigger," primario del	Primär-Jigger
Jigger, secondary	Secondaire de transformateur d'oscillation	Circuito secundario del trasformatore delle correnti oscillatorie	"Jigger," secundario del	Sekundär-Jigger
Key-sending	Manipulateur	Tasto manipolatore di trasmissione	Manipulador	Taste
Lamp, tuning—and choke	Lampe de Syntonisation avec bobine de réactance	Lampada di sintonizzazione con bobina	Lámpara de sintonización y de reactancia	Syntonisierlampe mit Indepedanz
Leyden jar	Bouteille de Leyde.	Bottiglia di Leyda.	Botella de Leyden.	Leydener Flasche
Leyden jar, battery of	Batterie de bouteilles de Leyde	Batteria di bottiglie di Leyda	Botellas de Leyden, Bateria de	Batterie Leydener Flaschen
Lightning arrester. (See Arrester, lightning)	Self de syntonisation	Induttanza d'aereo	Inductancia adicional	Verlängerung Spule
Loading coil	Amplificateur à transformateurs	Amplificatore magnetico	Amplificador magnético	Magnetische Verstärker
Magnetic amplifier	Mât, portatif	Abero, portatile	Mástil, portátil	Tragbarer Mast
Mast, portable	Mâts d'acier à sections	Abero di acciaio diviso in sezioni	Mástil de secciones de acero	Stahlmasten in Teilen
Masts, steel sectional	Mât, télescopique	Abero telescopico	Mástil telescópico	Teleskopmast
Mast, telescopic	Microphone	Microphono	—	Microphon
Microphone	Appareil microphone	Apparecchio microfonico	Aparato microfónico	Microphon-Apparat
Microphone apparatus	Micromètre à étincelle	Micrometro per Scintilla	Micrometro de chispa	Funkmikrometer
Micrometer, spark	Groupe moteur alternatif avec éclateur à disque	Gruppo convertitore con scaricatore a disco	Grupo de motor, alternador con estallador de disco	Wechselstromgenerator kombiniert mit Rotierende Funkenstrecke
Motor alternator disc set	Antenne multiple	Antenna multipla	Antena múltiple	Mehrfache Antenne
Multiple antenna	Transmission et réception multiples	Trasmisionee Ricezione multipla	Transmisión y recepción múltiple	Viel-fach Übermittlung und Empfang
Multiple transmission and reception	Oscillations électriques	Oscillazioni elettriche	Oscilaciones eléctricas	Elektrische-Schwingungen
Oscillations, electric.	Oscillateur à lampes	Oscillatore a lampes	—	Röhre sender
Oscillating valve				

ENGLISH.	FRENCH.	ITALIAN.	SPANISH.	GERMAN.
Oscillatory circuit . . . Overload . . .	Circuit oscillant . . . Surchage . . .	Circuito oscillante . . . Sovraccarica . . .	Circuito oscilante . . . Sobrecarga . . .	Schwingungs Kreis Überlast

Shunt, highly inductive	Rheostat en serie	Reostato en serie	Series Widerstand
Shunt, non-inductive	Station navale	Estación de a bordo	Schiffstation
Signals, balancing	Dispositif de mise en court circuit	Dispositivo de corto circuito	Kurzschliesser
Signals, telephone	Shunt à pouvoir inductif élevé	Shunt alta induzione	Shunt mit hohe Selbstinduktion
Span	Shunt, non-inductif	Circuito in derivazione non-induttivo	Nebenschluss
Spark	Signaux téléphoniques	Segnali equibrati	Balanciersignale
Spark coil, with hammer-break	Haubanage	Segnali del telefono	Telephonsignale
Spark gap	Étincelle	Campata	Abspannung
Spark gap, micrometric	Étincelle étouffée	Scintilla	Funkenspannung
	Bobine d'induction à interrupteur à intervalle	Rochetto d'induzione a martello	Funkenduktor mit Hammerunterbrecher
	Eclateur à étincelle	Oscillatore	Funkentrecke
	Eclateur à intervalle micrométrique	Oscillatore micrometrico	Micrometer Funkentrecke
Spark micrometer	Micromètre à étincelles	Micrometro di scintilla	Funkennikrometer
Spark gap, multiple	Eclateur en série	Oscillatore multiplo	Unterteilte Funkentrecke
Spark gap, quenched	Eclateur pour étincelle étouffée	Spinterometro per oscillazioni smorzate	Gedaempfte Funkentrecke
Sparking distance	Étincelle étouffée	Scintilla smorzata	Löschfunke
Specific inductive capacity	Distance explosive	Distanza esplosiva	Funkentrecke
	Capacité inductive spécifique	Capacità inductiva specifica	Dielectricitäts Konstante
Starter, automatic	Démarréur, automatique	Avviatore automatico	Selbstanlasser
Starter, combined with shunt regulator	Rhéostat de démarrage avec rhéostat de champ	Reostato di avviamento combinato con regolatore in derivazione	Anlasswiderstand mit Nebenschlussregler
Starter, single-phase	Démarréur monophasé	Avviatore per corrente monofase	Einphasenanlasser
Starter, three-phase	Démarréur tri-phasé	Avviatore per corrente trifase	Dreiphasenanlasser
Station, aeroplane	Aéroplane (poste d')	Station per aeroplano	Flugzeug Station
Station, airship	Station de ballon dirigeable	Station per aeromobile	Luftschiffstation
Station, cart type	Station du type sur voiture	Stazione del tipo su carri	Karren station
Station, cavalry	Poste de cavalerie	Stazione per cavalleria	Kavallerestation
Station, high-power	Station à grande puissance	Stazione di grande potenza	Kraftstation
Station, knapsack	Poste de harnais	Stazione da zaino	Tornierstation
Station, landing	Poste de débarquement	Stazione da sbarco	Landungsstation
Station, long-distance	Poste de grandes distances	Stazione ultrapotente	Radiotelegraphische Grosstation
Station, portable	Station portative	Stazione portatile	Tragbarestation

ENGLISH.	FRENCH.	ITALIAN.	SPANISH.	GERMAN.
Station, portable military.	Poste militaire transportable	Stazione militare mobile.	Estación militar portátil.	Tragbare Militärstation
Station, radiotelegraph.	Poste radiotélégraphique	Stazione radiotelegrafica	Estación radiotelegráfica.	Funkensamt
Station, small-power.	Station à faible puissance	Stazione di piccola potenza	Estación de pequeña potencia	Kleinstation
Swiss commutator.	Commutateur suisse	Commutatore tipo svizzero	Commutador suizo.	Schweizerische Kommutator
Switch, aerial change-over	Commutateur d'antenne.	Commutatore dell'antenna	Commutador para cambio de hilos de antena	Luftdrahtumschalter
Switch, aerial heating	Commutateur, échauffement d'antenne	Interruttore per riscaldamento dell'antenna	Commutador de seguridad contra calentamiento de la antena	Umschalter zum heizen der Antenne
Switch, automatic.	Interrupteur automatique	Interruttore automatico.	Interrupor automático.	Selbsttaetiger Schalte
Switch, automatic field break	Interrupteur automatique d'excitation	Interruttore automatico di eccitazione	Interrupor automático del campo	Selbsttaetiger Magnet-ausschalter
Switch, carbon break	Interrupteur à contacts de charbon	Interruttore a carbone.	Interrupor con contactos de carbón	Kohlenschalter
Switch, change-over	Commutateur	Commutatore	Commutador.	Umschalter
Switch, change-tune	Commutateur de longueurs d'ondes	Commutatore di sintonizzazione	Commutador de sintonización	Wellenumschalter
Switch, charging	Interrupteur de charge	Interruttore di carica.	Commutador de carga.	Ladeschalter
Switch, combined fuse and circuit	Interrupteur avec coupe circuit	Fusible ed interruttore combinati	Interrupor con fusible.	Schalter und Sicherung-kombiniert
Switch, double-bladed knife	Interrupteur bipolaire à lames	Interruttore doppio a coltello	Interrupor de cuchillo, bipolares	Doppelmesserschalter
Switch, double-pole.	Interrupteur bipolaire	Interruttore bipolare	Interrupor bipolar	Zweipoliger Schalter
Switch, double pole, double throw	Commutateur bipolaire à deux directions	Interruttore bipolare a doppio effetto	Commutador bipolar de dos posiciones	Zweipoliger Umschalter
Switchboard, d.c. and a.c.	Tableau de distribution pour courant continu et alternatif	Quadro di distribuzione per corrente continua ed alternata	Cuadro de distribución de c.a. y c.c.	Schalttafel fuer Gleich und Wechselstrom
Switch, field-break.	Interrupteur de l'excitation	Interruttore ad eccitazione	Interrupor del campo.	Magnetausschalter
Switch, high-tension	Interrupteur pour haute tension	Interruttore per alta tensione	Interrupor de alta tensión	Hochspannungsschalter
Switch, high-tension remote control	Téléinterrupteur pour haute tension	Interruttore ad alta tensione a distanza	Teleinterrupor de alta tensión	Hochspannungsfernschalter
Switch, over-break	Interrupteur à double coupure	Interruttore ad olio	Interrupor con baño de aceite	Öelschalter
Switch, press (toggle)	Interrupteur à pression	Interruttore a pressione	Interrupor de presión	Druckschalter

Waves, radiation of	Radiation des ondes	Irraggiamento di onde	Radiación de las ondas	Austrahlung der Wellen

GENERAL INFORMATION AND USEFUL TABLES

INTERNATIONAL RULES FOR THE USE OF SYMBOLS REPRESENTING QUANTITIES IN MATHEMATICAL CALCULATIONS

(a) Instantaneous values of electrical quantities which vary with the time to be represented by small letters. In case of ambiguity they may be followed by the subscript "t."

(b) Virtual or constant values of electrical quantities to be represented by capital letters.

(c) Maximum values of periodic electrical and magnetic quantities to be represented by capital letters followed by the subscript "m."

(d) In cases where it is desirable to distinguish between magnetic and electric quantities, constant or variable, magnetic quantities to be represented by capital letters of either script, heavy-faced or any special type. Script letters to be only employed for magnetic quantities.

(e) Angles to be represented by small Greek letters.

(f) Dimensions and special quantities to be represented, wherever possible, by small Greek letters.

1 gallon in wine, ale, or dry measure

= 277½ cubic inches = ·16 cubic foot

= 10 lb. of distilled water =

Cube feet × 6·2355 = gallons.

Cube ins. × ·003607 = gallons.

1 bushel = 2218·19 cube inches = 1·28 cube foot.

Cube feet = ·78 = bushels.

Cube ins. × ·00045 = bushels.

SQUARE OR SURFACE MEASURE.

144 square inches = 1 square foot.

9 square feet = 1 square yard.

30¼ square yards = 1 square rod or perch.

40 square rods = 1 rood.

4 roods = 1 acre (4,840 square yards).

640 acres = 1 square mile (3,097,600 square yards).

METRIC SYSTEM OF WEIGHTS AND MEASURES.

The Metric System is based upon the estimated length of the fourth part of a terrestrial meridian. The ten-millionth part of this arc is called a *Metre*, and is the unit of length. The cube of the tenth part of a metre was adopted as

the unit of capacity, and denominated a *Litre*. The weight of a litre of distilled water at its greatest density was called a *Kilogramme*, of which the thousandth part, or *Gramme*, was adopted as the unit of weight. The multiples of these, proceeding in decimal progression, are distinguished by the employment of the prefixes *deca*, *hecto*, *kilo*, and *myria*, and the subdivisions by *deci*, *centi*, and *milli*. The units in general use are as follows :—

MEASURES OF LENGTH (UNIT METRE).

Equal to	Metre.	Inches.	Feet.	Yards.	Miles.
Millimetre	0·001	0·039	0·003	0·001	0·000
Centimetre	0·010	0·393	0·032	0·010	0·000
Metre	1·000	39·370	3·280	1·093	0·000
Kilometre	1000·000	39370·790	3280·899	1093·633	0·621

CUBIC, OR MEASURES OF CAPACITY (UNIT LITRE).

Equal to	Cubic inches.	Cubic feet.	Pints.	Gallons.
Cubic Centimetre	0·061	0·000	0·001	0·000
Litre, or cubic decimetre	61·027	0·035	1·760	0·220
Cubic Metre	61027·051	35·316	1760·773	220·096

MEASURES OF WEIGHT (UNIT GRAMME).

Equal to	Grains.	Avoirdupois lb.	Cwt. = 112 lb.	Tons = 20 cwt.
Milligramme	0·015	0·000	0·000	0·0000
Gramme	15·432	0·002	0·000	0·0000
Kilogramme	15432·348	2·204	0·019	0·0009
Tonne = 1,000 kilograms.	—	2204·000	19·678	0·9859

SQUARE OR SURFACE MEASURE.

Equal to	Square feet.	Square yards.
Square Metre	10·7643	1·196

Hectare = 10,000 sq. met. = 11,960 sq. yds. = 2·47 acres.

The Metric System of Weights and Measures, which, as plainly demonstrated in the preceding pages, is logically symmetrical, now forms the usual standard in the following countries :—

*Argentine Republic.	Egypt.	*Peru.
Austria Hungary.	France.	Portugal.
Belgium.	German Empire.	†Roumania.
*Bolivia.	†Greece.	Servia.
*Brazil.	Holland.	*Spain.
*Chile.	Italy.	Sweden.
*Colombia.	*Mexico.	
Denmark.	Norway.	

* Old Spanish measures also occasionally used are :—

Onza	=	1·014 ounce avoirdupois.
Libra	=	1·014 lb. avoirdupois.
Quintal	=	101·44 lb. avoirdupois.
Arroba (of 25 libras)	=	25·36 lb. avoirdupois.
Arroba of Wine	=	6·70 Imperial gallons.
Gallon	=	0·74 Imperial gallon.
Vara	=	0·927 yard.
Square Vara	=	0·859 square yard.

† Turkish measures are also in use :—

Oke of 410 drams	=	2·8283 lb. avoirdupois.
Almud	=	1·151 Imperial gallons.
Kileh	=	0·9120 Imperial gallon.
44 okes = 1 Cantar	=	124·3616 lb. avoirdupois.
39·6263 okes	=	1 cwt.
180 okes = 1 Tcheké	=	509·095 pounds.
1 kileh = 20 okes	=	0·36 Imperial quarter.
816 kilehs	=	100 Imperial quarters.

The following countries have not adopted the Metric System :—

CANADA.—The legal Weight and Measures are the Imperial Yard, Imperial pound avoirdupois, Imperial gallon, and the Imperial bushel. By Act 42 Vict., cap. 16, the British hundredweight of 112 pounds and the ton of 2,240 pounds were abolished, and the hundredweight was declared to be 100 pounds, and the ton 2,000 pounds avoirdupois as in United States, but sometimes contracts stipulate for the British weights.

CHINA.—

Weights— 10 Ch'ien = 1 Liang (Tael) = 1.333 oz. avoirdupois or 37.78 grammes
 16 Liang = 1 Kin (Catty) = 1.333 lb. avoirdupois or 604.53 grammes
 100 Chin = 1 Tan (Picul) = 133.333 lb. avoirdupois or 60.453 kilogrammes
 4 ozs. = 3 taels; 1 lb. = $\frac{3}{4}$ catty or 12 taels; 1 cwt. = 84 catties; 1 ton = 16 piculs 80 catties

Capacity—10 Ko = 1 Sheng (pint) = 1.031 litre
 10 Sheng = 1 Tou (peck) = 10.31 litre (holding from 6½ to 10 Kin of rice and measuring from 1.13 to 1.63 gallon)

Commodities, even liquids, such as oil, spirits, etc., are commonly bought and sold by weight.

Length—10 Fen = 1 Ts'un (inch)
 10 Ts'un = 1 Chi'h (foot) = 14.1 English inches by treaty
 10 Chi'h.. .. = 1 Chang = 11 ft. 9 in. (141 in. by treaty)
 1 Li = $\frac{1}{2}$ English mile (about)

The mow, the unit of measurement, is almost exactly one-sixth of an acre.

In the tariff settled by treaty between Great Britain and China, the Chi'h of 14 $\frac{1}{10}$ English inches has been adopted as the legal standard. The standards of weight and length vary all over the Empire, the Chi'h ranging from 9 to 16 English inches, and the Chang (= 10 Chi'h) in proportion; at the treaty ports, the use of foreign treaty standard of Chi'h and Chang is common.

In October, 1907, a decree for uniform weights and measures was issued, making the K'up'ing or Treasury Scale the standard weight. The K'up'ing tael or ounce weighs 575.64 grains. The Haikwan tael weighs 581.47 grains.

INDIA.—The Maund of Bengal.

40 Seers = 82½ lb. avoirdupois
 The Maund of Madras .. = 25 lb. avoirdupois (nearly)
 The Tola = 180 grains troy
 The Guz of Bengal .. = 36 inches

An Act to provide for the adoption of an uniform system of weights and measures was passed in 1871. The Act orders: "Art. 2. The primary standard of weight shall be called a seer, and shall be a weight of metal in the possession of the Government of India, equal, when weighed in a vacuum, to the weight known in France as the kilogramme = 2.205 lb. avoirdupois." "Art. 3. The units of weight and measures of capacity shall be, for weights, the said

seer; for measures of capacity, a measure containing one such seer of water at its maximum density, weighed in a vacuum. Unless it be otherwise ordered, the subdivisions of all such weights and measures of capacity shall be expressed in decimal parts." This Act, however, has never been in operation.

JAPAN.—

The Mommé	= 2.11 drams or 2.41 dwts. or 120 mommé=1 lb. avoirdupois
The Kin (Catty)=160 mommé	= 1.322 lb. avoirdupois (0.266 mommé=1 gramme) or 1.60 lb. troy
The Picul (100 kin)	= 132.27 lb.
The Kwan=1,000 mommé ..	= 8.261 lb. avoirdupois or 10.04 lb. troy
The Shaku	= .994 foot (3.3 shaku=1 metre)
The Kujira Shaku	= 1.242 feet
The Sün	= 1.193 inches
The Ken=6 Shaku	= 5.965 feet
The Jo=10 Shaku	= 9.942 feet
The Chô=60 Ken	= 357.916 feet, or about $\frac{1}{15}$ mile
The Ri=36 Chô	= 2.44 miles
The Ri (marine)	= 1.15 mile
The Ri (square)	= 5.9552 square miles
The Chô=10 tan	= 2.45 acres
The Koku, Liquid=10 To=100 Sho	= 39.7033 gallons
The Koku, Dry	= 4.9629 bushels
The Koku (capacity of vessel)	= $\frac{1}{10}$ ton
The To, Liquid	= 3.9703 gallons
The To, Dry	= 1.9851 peck

RUSSIA.—

1 Verst (500 sajènes)	= 3,500 feet, or two-thirds of a statute mile
1 Sajène (3 arshins)	= 7 feet
1 Arshin (16 vershok)	= 28 inches
1 Square Verst	= 0.43941 square mile
1 Dessiatine	= 2.69972 acres
1 Pound (96 zolotniks=32 lot)	= $\frac{9}{16}$ of a pound or 14.4 ounces
1 Pood (40 pounds)	= 36.113 lb.=0.32244 cwt. or 100 poods = 1.6121 tons. Baltic Freight is usually quoted per ton of 62 poods
1 Vedro (8 shtoffs)	= 2 $\frac{1}{4}$ Imperial gallons
1 Chetvert (8 chetveriks) ..	= 5.77 Imperial bushels or 46.2 gals.

UNITED STATES.—

British weights and measures are usually employed, but the old Winchester gallon and bushel are used instead of the new or Imperial standards. Different States have a legal standard for bushels of certain articles, such as grain and potatoes, varying from 60 lb. for wheat to 32 for oats.

Wine gallon	= 0.83333 gallon
Ale gallon	= 1.01695 gallon
Bushel	= 0.9692 Imperial bushel

Instead of the British cwt. a cental of 100 lb. is used. 1 ton=2,000 lb., except coal, which is usually 2,240 lb. wholesale.

TT

NAUTICAL MEASURES

(From "Lloyd's Calendar," by permission of the Committee of Lloyd's.)

12 inches=1 foot	6 feet=1 fathom
3 feet=1 yard	3 nautical miles	..=1 league

Sea or Nautical Mile=one-sixtieth of a degree of latitude, and varies from 6,046 ft. on the Equator to 6,092 ft. in lat. 60°

Nautical Mile for speed trials, generally called the Admiralty Measured Mile $\left\{ \begin{array}{l} 6,080 \text{ feet} \\ 1.151 \text{ statute miles} \\ 1,853 \text{ metres} \end{array} \right.$

Cable's length=the tenth of a nautical mile; or, approximately, 100 fathoms or 200 yards.

A Knot=a nautical mile an hour, is a measure of speed, but is not infrequently, though erroneously, used as synonymous with a nautical mile.

Length of European Measures of Distances compared with the Nautical Mile of 6,080 ft.

	Length in Nautical Miles.		Length in Nautical Miles.
Nautical Mile	1.000	German Ruthen	4.064
British Statute Land Mile	0.868	Italian Mile	1.000
Austrian Mile	4.094	Norwegian Mile	6.097
Danish Mile.. ..	4.064	Russian Verst	0.576
French Kilometre	0.539	Swedish Mile	5.769
German Geographical Mile	4.000		

DISTANCE OF HORIZON AT SEA.

Let h be the height of the observer's eye above sea level, D the distance to the horizon, and R the earth's radius.

Then

$$D^2 = 2Rh$$

And thus D in statute miles = $1.22 \sqrt{h}$ in feet

D in kilometres = $2.52 \sqrt{h}$ in metres

An object of height h^1 is seen by an eye at height h at a distance D^1 given by

D^1 in statute miles = $1.22 \sqrt{h}$ in feet + $\sqrt{h^1}$ in feet

D^1 in kilometres = $2.52 \sqrt{h}$ in metres + $\sqrt{h^1}$ in metres

The distance of the horizon—i.e., the greatest distance at which the surface of the sea is visible—varies somewhat with refraction in the atmosphere, but is, on clear days, approximately as below:—

Elevation Feet.	Miles.	Elevation Feet.	Miles.	Elevation Feet.	Miles.
5.....	2.96	50.....	9.35	500.....	29.58
10.....	4.18	100.....	13.23	1000.....	33.40
20.....	5.92	200.....	18.72	5280.....	96.18
		300.....	22.91		

METHOD OF DENOTING THE TRUE BEARING AND COURSE OF A SHIP AT SEA

As regards the true bearing of the ship from the coast station, the degrees are reckoned "clockwise" from north round through east, south and west.

Thus, if the ship's bearing from the coast station is anything between north and east, the number to be signalled will be between 0 and 90.

Between east and south the number will be between 90 and 180.

Between south and west the number will be between 180 and 270.

Between west and north the number will be between 270 and 360.

Similarly, if the ship's course is between N. and E. the number to be signalled will be between 0 and 90.

Between E. and S. the number to be signalled will be between 90 and 180.

Between S. and W. the number to be signalled will be between 180 and 270.

Between W. and N. the number to be signalled will be between 270 and 360.

To facilitate the conversion of the bearing and course into the number of degrees to be signalled, a table is appended in which either the bearing of the ship from the coast station, or the bearing of the coast station from the ship can be ascertained and the number of degrees to be signalled seen at a glance. The course must be looked for in the same column as the bearing of the ship from the coast station.

Thus a ship 150 miles bearing S 75° W. from a coast station and steaming S. 85° E. at 15 knots, and having telegrams comprising 75 words to send, on receiving the signal to Go (— • —) from the coast station, would signal the following (Rule 22 of Part II):—

— • — • — XYZ — • • • ABC 150 255
 95 15 75 • — • — •
 (end).

TABLE TO CONVERT BEARING AND COURSE INTO DEGREES.

MEASURES OF TIME

The earth's axial rotation is the phenomenon by which time is measured everywhere on the earth's surface. Experiment and observation show that if we assume the earth to rotate uniformly, there are many other phenomena which are as accurately isochronous in their periodicity. That is to say, they pass again and again through all their phases in exactly the same interval of time as measured in terms of the earth's rotation. In the pendulum of a clock and the balance wheel of a watch we have such isochronism very approximately realised. A little consideration will convince us that the measurement of time is really a comparison of periodic sequences. We cannot conceive any other mode of marking off time intervals than by some kind of motion of a periodic character. Our practical unit of time is essentially terrestrial.

SIDEREAL DAY.—The standard unit of time is the **SIDEREAL DAY**, being the period in which the earth turns once round on its axis. It is divided into sidereal hours, minutes, and seconds; but these measures of time are used by astronomers only.

MEAN SOLAR TIME.—A **SECOND** is the time of one swing of a pendulum adjusted so as to make 86,164.09 swings in a sidereal day. Seconds are usually subdivided decimally.

One **MEAN SOLAR DAY** = 24 hours = 1,440 minutes = 86,400 seconds = 1.00273791 sidereal day.

RELATION BETWEEN TIME AND LONGITUDE.—At any given instant the mean solar time at two stations differ by an amount proportional to their difference of longitude, the time at the eastern station being the earlier.

CORRESPONDING DIFFERENCES.

Longitude.	Time.	Longitude.	Time.
15"	1 second.	75°	5 hours.
1'	4 seconds.	90	6 "
15'	1 minute.	105	7 "
1°	4 minutes.	120	8 "
15°	1 hour.	135	9 "
30	2 hours.	150	10 "
45	3 "	165	11 "
60	4 "	180	12 "

To show the exact date of any event, the meridian at which the time is reckoned must be specified. One degree longitude at Equator = 60 nauts = 69.17 statute miles.

STANDARD OR ZONE TIME.

Country.	Central Meridian.	Fast or Slow on Greenwich Time.*
Western Europe, Algeria	0°	Greenwich Time

Mountain	105° W.	7 h. slow
Pacific (British Columbia, etc.)	120° W.	8 h. slow
Alaska	135° W.	9 h. slow
Hawaii or Sandwich Islands	157° 30' W.	10½ h. slow
Samoa	172½° W.	11½ h. slow

* Greenwich time is used in France, Spain, Portugal, Belgium, Gibraltar, and the Faroes.

BELL TIME ON BOARD SHIP.

The nautical day begins at noon and is divided into "watches" of four hours each, time being indicated by bells striking every half-hour.

A.M.	A.M.	A.M.	P.M.	P.M.
12.30	4.30	8.30....1	BELL12.30	4.30 8.30
1.00	5.00	9.00....2	BELLS.... 1.00	5.00 9.00
1.30	5.30	9.30....3	BELLS.... 1.30	5.30 9.30
2.00	6.00	10.00....4	BELLS.... 2.00	6.00 10.00
2.30	6.30	10.30....5	BELLS.... 2.30	6.30 10.30
3.00	7.00	11.00....6	BELLS.... 3.00	7.00 11.00

FOREIGN AND COLONIAL MONEYS WITH APPROXIMATE VALUE IN BRITISH CURRENCY AT NORMAL RATES OF EXCHANGE

ARGENTINE REPUBLIC.—Gold coin, 5 dollars. Silver coins, 1 dollar and 50, 20, and 10 centavos. Bronze coins, 2 and 1 centavos. Nickel coins, 20, 10 and 5 centavos. Silver dollar or peso=4s. Money in circulation is chiefly paper, being converted at 44 cents gold to dollar=1s. 9d. Gold dollar=4s.

AUSTRALIA.—The same as in Great Britain.

AUSTRIA-HUNGARY.—Gold coins, 100 krone=£4 3s. 4d.; 20 krone=16s. 8d.; 10 krone=8s. 4d.; Single ducat=11 crowns 29 heller=9s. 4½d. Silver coin, 1 krone=100 heller=half gulden old coinage=10d. Exchange

about 24 krone to £. Silver gulden or florins (about 12=£)=100 kreutzer continue to be legal tender. Nickel, 20 heller=10 kreutzer of old coinage=2d., 10 heller=5 kreutzer of old coinage=1d. Bronze, 2 heller=1 kreutzer= $\frac{1}{2}$ d., 1 heller= $\frac{1}{4}$ kreutzer= $\frac{1}{10}$ d.

BELGIUM.—The same as France.

BOLIVIA.—100 centavos=1 boliviano (paper)=about 1s. 7d., or 12 $\frac{1}{2}$ bolivianos to £. Coins in circulation are—silver, 50, 30, 20 and 10 centavos; nickel, 10 and 5 centavos, and English gold coin. Currency principally paper.

BRAZIL.—Currency paper, worth 1s. 4 $\frac{1}{2}$ d. per milreis (1,000 reis) or nearly 15 milrei=£1. Silver coinage of 2, 1 and $\frac{1}{2}$ milreis pieces in circulation.

BRITISH HONDURAS.—100 centavos=1 dollar (gold)=4s. 1 $\frac{1}{2}$ d. British sovereign (= \$4.86) and half sovereign, and U.S. gold coins legal. Silver coins—5, 10, 25 and 50 cents legal tender to \$10. Bronze—1 cent. legal tender to 50 cents.

BULGARIA.—Lev (=franc) = 100 stotinki=9 $\frac{1}{2}$ d. (stotinka=centime). Gold coins, 10 and 20 leva, but foreign 10 and 20 franc pieces principally in circulation. Silver, $\frac{1}{2}$, 1, 2 and 5 leva. Nickel, 2 $\frac{1}{2}$, 5, 10, 20 stotinki. Bronze, 1, 2, 5, 10 stotinki.

CANADA.—1 cent= $\frac{1}{2}$ d. 100 cents=1 dollar=about 4s. 1 $\frac{1}{2}$ d. 4 dollars 86 $\frac{2}{3}$ cents=£ sterling. U.S. gold coins also legal.

CHILI.—Gold coins, 20 (colon or condor), 10 (doubloon), and 5 (escudo) peso pieces. Silver coins, 1 peso and $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$ of a peso. Bronze coins, $\frac{1}{2}$, 1, 2 and 2 $\frac{1}{2}$ centavo pieces. Currency is paper—the peso or dollar=about 10d. The restoration of the gold currency is projected under a currency law which was to take effect in 1910, but has been since deferred. Gold peso=1s. 6d. English sovereign has a legal value of 13 $\frac{1}{4}$ pesos gold.

CHINA.—1,220 (about) cash=1 haikwan (or customs) tael=about 2s. 8 $\frac{1}{2}$ d. About 35 cash=1d. A coin recently issued is the "hundredth of a dollar" worth about $\frac{3}{8}$ of 1d. Silver dollar of same value as Japanese silver yen, is also current. At Hong-Kong the dollar (1,000 cash)=about 1s. 11d. and at Shanghai about 2s. 8d. In October, 1908, an Imperial Edict decreed the establishment of a uniform Tael currency—unit silver tael to have a value of between 30d. and 40d.

COCHIN CHINA.—5 sapèques or cash=1 cent; 100 cents=1 dollar=about 2s.

COLOMBIA.—100 centavos=1 peso or dollar gold—nominal value 4s. Gold coins, 1, 2 $\frac{1}{2}$ and 5 dollars. Silver coins, real peseta, half-dollar and dollar. Very few coins are in circulation, the currency being principally paper, subject to considerable fluctuation. At the legal rate the paper peso=1 centavo gold, or \$500=£1.

DENMARK.—100 Oere=1 Krone=1s. 1 $\frac{1}{2}$ d. 18 Kroner 19 Oere=£ sterling. Gold coins of 20 Kroner and 10 Kroner. Silver, 2 Kroner, 1 Krone, 25 Oere, and 10 Oere.

EGYPT.—97 $\frac{1}{2}$ piastres=£ sterling. 100 piastres, or 1,000 milliemes=£ Egyptian (gold)=£1 os. 6 $\frac{1}{2}$ d. Gold circulating is almost exclusively English. 10 milliemes=1 piastre=about 2 $\frac{1}{2}$ d. Gold piece of 20 francs=about 77 piastres. Silver coins, 1, 2, 5, 10 and 20 piastres; legal tender to £2.

ERITREA.—1 tallero=5 Italian lire. Silver coins, 1, 2, 5 talleros.

FRANCE.—100 centimes=1 franc= $9\frac{1}{4}$ d. 20 franc piece (Louis or Napoleon)=15s. 10d. About 25 francs 25 centimes= $\frac{1}{2}$ sterling. Gold coins of 5, 10, 20, 50 and 100 francs. Silver coins 20 centimes, $\frac{1}{2}$, 1, 2 and 5 franc pieces. Nickel coin, 25 centimes. Bronze coins, 1, 2, 5 and 10 centimes.

GERMANY.—100 pfennig=1 mark=about 1s. About 20.45 m.= $\frac{1}{2}$ sterling. Gold coins, 20 (doppel-krone), 10 (krone), and 5 (half-krone) marks. Silver coins, 1, 2, 3 and 5 marks and 50 pfennige. Thaler=3 marks=2s. 11d. Nickel coins, 20, 10 and 5 pfennige. Bronze coins, 1 and 2 pfennige.

GREECE.—100 lepta=1 drachma paper=9d. 27 drachmæ 30 lepta= $\frac{1}{2}$ l or about 108 drachmæ per 100 fcs. Foreign gold coins in circulation.

HOLLAND.—100 cents=1 guilder or florin=1s. 8d. 12 guilders 10 cents= $\frac{1}{2}$ sterling. Gold coins, 10 florins (16s.). Silver coins, 2 $\frac{1}{2}$ guilders (rijksdaaler), 1 guilder, $\frac{1}{2}$ guilder and 25 cents.

INDIA.— $\frac{1}{2}$ l = 15 rupees. 16 annas=1 rupee=1s. 4d. 3 pie=1 pice, 12 pie=1 anna=1d. Lac of rupees=100,000. Crore of rupees=10,000,000.

ITALIAN SOMALILAND.—Rupia, value L. It. 1.68 (= $\frac{1}{15}$ ster.). Silver coins, 1 rupia, $\frac{1}{2}$ rupia, $\frac{1}{4}$ rupia. Bronze coins, 1 besa (value L. It. 0.0168) 2 besas, 4 besas. 1 rupia is equal to 100 besas.

ITALY.—100 centesimi=1 lira= $9\frac{1}{4}$ d. About 25 lire 40 centesimi= $\frac{1}{2}$ l sterling. Gold coins, 100, 50, 20 and 10 lire. Silver coins, 5, 2, and 1 lira. Nickel coin, 20 centesimi. Bronze coins, 1, 2, 5 and 10 centesimi.

JAPAN.—10 rin=1 sen= $\frac{1}{4}$ d., 100 sen=1 yen or dollar=2s. 0 $\frac{1}{2}$ d. Gold coins 5, 10, and 20 yen. Silver coins, 10, 20 and 50 sen. Nickel coin, 5 sen. Bronze coins, 1 sen and 5 rin. The unit of account is the gold yen.

LIBYA.—The same currency as in Italy.

MEXICO.—100 centavos=1 dollar or peso (silver)=2s. 0 $\frac{1}{2}$ d.

NORWAY.—100 ore=1 krone=1s. 1 $\frac{1}{4}$ d. Gold coins, 10 and 20 kroner. Exchange 18.19 kroner= $\frac{1}{2}$ sterling. Paper money principally used; least value, 5 kroner. Below this amount, silver and copper coins.

PORTUGAL.—100 reis=1 teston=4d. 1,000 reis=1 milreis. Paper milreis=about 4s. 1d. Gold coins, 1, 2, 5 and 10 milreis. Currency, principally paper. Conto=1,000 milreis. In the Azores, 1 milrei=3s. 6 $\frac{1}{2}$ d.

ROUMANIA.—1 leu=100 bani=about 9 $\frac{1}{4}$ d. Gold coins, 5, 10 and 20 lei. Silver, 1 leu, 2 and 5 lei. Nickel, 5, 10 and 20 bani.

RUSSIA.—100 copecks=1 rouble. Silver or paper rouble=2s. 1 $\frac{1}{4}$ d. Gold coins—15 roubles (imperial), 10 roubles, 7.50 roubles (half-imperial), 5 roubles. 15 paper roubles=10 roubles gold=roughly 1 guinea. Currency principally paper.

SERVIA.—Dinar=1 franc= $9\frac{1}{4}$ d. Gold coins, 10 and 20 dinars. Silver, $\frac{1}{2}$, 1, 2, 5 dinars. Bronze, 5 and 10 paras. Nickel, 5, 10, 20 paras.

SPAIN.—100 centimos=1 peseta—about 26.70 pesetas to the $\frac{1}{2}$ sterling. Gold coins are 20, 10 and 5 peseta pieces. Silver coins, 1 and 5 pesetas.

STRAITS SETTLEMENT AND MALAY STATES.—Gold dollar=2s. 4d. Silver coins—50, 20 10 and 5 cent pieces—are legal tender to 2 dollars, but $\frac{1}{2}$ dollar is unlimited tender. Copper coins—1, $\frac{1}{2}$ and $\frac{1}{4}$ cents—are legal tender to 1 dollar.

SWEDEN.—Krona of 100 ore = 1s. 1½d. or 18·19 kr. to the £1. Gold little used. Currency for 5 kr. or more mostly paper.

TURKEY.—40 paras = 1 piastre = 2½d. nearly. 100 piastres = 1 lira turca or gold medjidie = 18s. 109½ pias = £1. "Purse," sometimes used in accounts = 500 piastres or 5 liras and is calculated = £4 10s. od. Value of piastre varies in different parts of the Turkish Dominions. In Syria 1 Turkish £ = 130 local piastres and £1 = 143½ local piastres.

UNITED STATES.—1 cent = about ½d., 100 cents = 1 dollar = 4s. 1½d. 4 dols. 87 cents = £ sterling. Gold coins, 2½ dollar piece, half eagle (5 dollars), 1 eagle (10 dollars), 1 double eagle (20 dollars).

URUGUAY.—100 centavos = 1 dollar (gold) = about 4s. 3d., or \$4·70 = £. Only foreign gold coins (which are legal tender) are in circulation. Silver coins, 10, 20 and 50 cents and 1 dollar. Nickel, 1, 2 and 5 cents.

VENEZUELA.—Medio = about 2½d.; real = about 5d. Monetary unit is silver bolivar = about 9½d., or 1 franc, or 25·25 bols. to the £. Exchange fluctuates slightly from the par, but 25·25 bols to the £ should be taken as a basis. Currency is based on gold standard—no paper in circulation. Coins are gold, silver and nickel, but principal coin is silver dollar of 5 bols. known as "peso fuerte" or simply "fuerte."

ATOMIC AND ELECTRONIC DATA

The radius of a hydrogen molecule is $1·2 \times 10^{-8}$ cms.

The mass of a hydrogen molecule is $3·3 \times 10^{-24}$ gms.

The average velocity of a molecule in air at 15° C. is 459 metres per second.

The mean free path of a molecule in air at atmospheric pressure is $1·42 \times 10^{-3}$ cms.; in a soft valve of typical pressure ·5 mm. the mean free path is $2·16 \times 10^{-3}$ cms.; while in a hard valve of pressure 10^{-6} mm. the mean free path is 12,500 cms.

The number of molecules per cc. at atmospheric pressure is $2·75 \times 10^{19}$; thus their average distance apart is 3×10^{-6} cms.

The number of molecules per cc. in a soft valve of pressure ·5 mm. is $1·8 \times 10^{16}$; thus their average distance apart is $3·8 \times 10^{-6}$ cms.

The number of molecules per cc. in a hard valve of pressure 10^{-6} mm. is $3·6 \times 10^{10}$; thus their average distance apart is 3×10^{-6} cms.

The negative charge on an electron is 4·774 electrostatic units or $15·91 \times 10^{-20}$ coulombs.

The diameter of an electron is 4×10^{-13} cms.

The mass of an electron is 9×10^{-28} gms.

The velocity of an electron after falling through a potential drop of V volts is $6 \times 10^7 \sqrt{V}$ cms. per second; thus after falling through a potential of 100 volts the electronic velocity is $6 \times 10^7 \times \sqrt{100} = 6 \times 10^8$ cms. per second.

VALVE NOMENCLATURE AND SYMBOLS

Let i_g , i_a , v_g and v_a represent grid and anode currents and potentials. (See Figure.)

Then $a_g = \frac{\delta i_a}{\delta v_g} =$ mutual conductance

$a_a = \frac{\delta i_a}{\delta v_a} =$ anode conductance

$g_k = \frac{\delta i_k}{\delta v_g} =$ grid conductance

$g_a = \frac{\delta i_g}{\delta v_a} =$ conjugate mutual conductance

Voltage Amplification Factor of Tube (k) $= \frac{\frac{\delta i_a}{\delta v_g}}{\frac{\delta i_a}{\delta v_a}} = \frac{\delta v_a}{\delta v_g} = \frac{\text{mutual conductance}}{\text{anode conductance}}$

Current amplification Factor of Tube $= \frac{\delta i_a}{\delta i_g} = \frac{\frac{\delta i_a}{\delta v_g}}{\frac{\delta i_g}{\delta v_g}} = \frac{\text{mutual conductance}}{\text{grid conductance}}$

The following methods of measuring the mutual conductance and the voltage amplification constant of a particular tube (from which two quantities the anode conductance can be obtained by dividing the first by the second) are now in common use.

DETERMINATION OF MUTUAL CONDUCTANCE

(APPLETON'S METHOD.)

Circuit (1).

In circuit (1) where R and r are non-reactive resistance (r being small) the value of R is adjusted for minimum sound in the telephone-amplifier. The mutual conductance is then given by the equation

$$a_g = \frac{1}{R}$$

DETERMINATION OF VOLTAGE AMPLIFICATION CONSTANT **(MILLER'S METHOD.)**

Circuit (2).

In circuit (2) R_1 and R_2 are non-reactive resistances, preferably quite small (a metre bridge wire is convenient). The ratio of R_1 to R_2 is adjusted to produce minimum sound in the telephone amplifier.

The voltage amplification factor k is then given by the equation

$$k = \frac{R_1}{R_2}$$

Also, the anode conductance is given by $a_a = \frac{a_g}{k} = \frac{R_2}{R_1 R}$

CONVENTIONAL SIGNS USED IN WIRELESS DIAGRAMS

	Continuous Current Motor or Dynamo.		Shielded Capacity.		Microphone.
	Battery.		Ohmic Resistance (Inductionless).		Telephone.
	Alternator of Low or Audio Frequency.		Fixed Self-Inductance.		Aerial or Antenna.
	High Frequency Alternator.		Variable Self-Inductance.		Large Fixed Condensers (generally of low voltage).
	High Tension Transformer.		Iron-Cored Inductance.

	Fixed Capacity.		Thermionic Valve, Three-Electrode. A Anode or Plate, G Grid, F Filament.		
	Continuously Variable Capacity.				

**COMPANIES ENGAGED IN THE
COMMERCIAL DEVELOPMENT
OF RADIOTELEGRAPHY AND
RADIOTELEPHONY**

PARTICULARS OF COMPANIES ENGAGED IN THE COMMERCIAL DEVELOPMENT OF WIRELESS TELEGRAPHY & TELEPHONY

Amalgamated Wireless (Australasia), Ltd.

Incorporated.—July 11th, 1913, in the State of New South Wales.

Head Office.—"Wireless House," 97, Clarence Street, Sydney, New South Wales.

Melbourne Office.—422/4, Chancery Lane, Melbourne, Victoria.

New Zealand Office.—"Australasia Chambers," Customs House Quay, Wellington, New Zealand.

Directors.—Hon. Sir Thomas Hughes, M.L.C. (Chairman), C. P. Bartholomew, Esq., Ernest T. Fisk, Esq., Alfred Goninan, Esq., James Taylor, Esq., F.C.P.A., Capt. T. Langley Webb.

Managing Director.—Ernest T. Fisk.

Assistant Manager and Secretary.—J. F. Wilson.

Accountant.—F. W. Larkins, A.I.I.A., A.C.I.S.

Factory Manager.—S. M. Grime.

Sales Manager.—V. Gardiner.

TECHNICAL DEPARTMENT:—Superintendent.—G. Apperley.

MARINE DEPARTMENT:—Traffic Manager.—J. L. Mulholland. **Equipment Manager.**—D. Campbell.

MARCONI SCHOOL:—Manager.—A. R. Mancer.

MELBOURNE BRANCH:—Manager.—L. A. Hooke.

NEW ZEALAND BRANCH:—Manager.—G. Robertson.

Capital.—Authorised £200,000. Issued £160,000 in 160,000 shares of £1 each, all fully paid up. Financial year of the Company ends at June 30th. The annual general meeting is held in August.

The Company owns the sole and perpetual licence to use and exploit all Marconi Patents, also all Patents for the Poulsen Pedersen and Quenched Singing Spark Systems in the Commonwealth of Australia, in the Dominion of New Zealand, and in parts of the Pacific and Indian Oceans.

It has a large organisation for manufacturing wireless telegraph apparatus, erection and operation of stations, and the system is installed on over 200 passenger and cargo ships.

The Company also controls The Wireless Press, Sydney, booksellers and publishers of "Sea, Land and Air," and the Australalectric Company, Sydney, manufacturers and suppliers of Amateur Wireless and all descriptions of electrical apparatus, which Company holds a number of important and exclusive agencies.

Accounts.—The accounts are made up to June 30th in each year. The profit and loss account for the twelve months ended June 30th, 1920, shows that the gross profit from trading account, radio-telegraphic traffic, ships' subsidies, etc., amounted to £47,032 19s. 4d., and after deducting all expenses (including depreciation amounting to £5,389 2s. 5d.) there was a net profit of £8,847 10s. 5d., from which a dividend at the rate of 5 per cent. per annum was paid.

Reserve accounts at June 30th, 1920, stood at £36,314 0s. 8d. Dividends, 1913-14, 4 per cent., 1914-15, 6 per cent.; 1915-16, 5 per cent.; 1916-17, 5 per cent.; 1917-18, 5 per cent.; 1918-19, 5 per cent.; 1919-20, 5 per cent.

American Radio and Research Corporation

Incorporated.—June 15th, 1915.

Head Office.—Medford Hillside, Massachusetts.

Sales Office.—21, Park Row, New York City, New York, U.S.A.

Directors.—J. Axten, Havens Grant, and H. J. Power.

Vice-President and General Manager.—Harold J. Power.

Secretary.—Havens Grant.

Capital.—\$300,000.

Dividends.—Close corporation.

The Company was formed for the operation of Wireless Telegraphy and the manufacture of Wireless Telegraph Apparatus.

Australalectric Company (The)

Formed.—August, 1918.

Head Office.—97, Clarence Street, Sydney, New South Wales.

Works.—242, Kent Street, Sydney, New South Wales.

Branch Offices.—422/4, Chancery Lane, Melbourne, Victoria; "Australasia Chambers," Wellington, New Zealand.

Companies Engaged in Commercial Development of Wireless 1265

Officers.—General Manager, Ernest T. Fisk. Assistant Manager, J. F. Wilson. Sales Manager, V. Gardiner.

The Company is owned and controlled by Amalgamated Wireless (Australasia), Ltd. It was formed for the purpose of exploiting amateur wireless apparatus manufactured by the parent concern. The operations of the Company now embrace the manufacture and sale of general electrical apparatus and accessories.

Some valuable and exclusive agencies are held by the Company, including Relay Automatic Telephones, Diamond Dry Cells, and Ozonair.

Chinese National Wireless Telegraph Company (The)

Incorporated.—Under Special Charter by virtue of an agreement dated May 24th, 1919, between The Government of the Republic of China and Marconi's Wireless Telegraph Company, Ltd.

Office.—5, Peh Ch'a Ta Fu Ssu, Peking.

Directors.—Lieut.-Gen. Ting Ching (Chairman), Rear-Admiral Chen Ngen Tao, Lin Chih Hsiu, Godfrey C. Isaacs, T. A. Barson, A. H. Ginman (Vice-Chairman and Managing Director).

Secretary.—Sohstu G. King.

Capital.—Authorised £700,000 in 700,000 shares of £1 each.

The Company was formed to manufacture, sell and maintain wireless telegraph and telephone apparatus in China, and has been granted a licence by Marconi's Wireless Telegraph Company, Ltd., giving it the sole right to use in China all the Marconi Company's Patents, present and future, for wireless telegraphy and telephony.

Compagnie D'Exploitation Radio-Electrique

Incorporated.—April 24th, 1919.

Head Office.—79, Boulevard Haussmann, Paris.

Directors.—MM. Bousquet (President), Baron de la Chevrelière (Vice-President), N. Pietri, E. Girardeau, E. Sins, Dal Piaz, Musnier, Max Robert, and Tronchon.

Managing Director.—M. N. Pietri.

Capital.—2,500,000 francs, divided into 25,000 shares of 100 francs each.

The Company owns and operates wireless telegraph apparatus on merchant vessels.

The Company also operates aeroplane wireless stations.

Compagnie Générale de Télégraphie Sans Fil

Incorporated.—February 5th, 1918.

Head Office.—79, Boulevard Haussmann, Paris.

Directors.—H. Bousquet (President), Baron de la Chevrelière (Vice-President), A. L. Atthalin, M. Bloch, A. Dupont, E. Girardeau, Godfrey C. Isaacs, E. May, N. Pietri.

Managing Director.—E. Girardeau.

General Manager.—Ernest Sins.

Chief Engineers.—Commander Brenot, Commander Garnier.

Capital.—25,000,000 francs, divided into 50,000 shares of 500 francs each, subscribed and fully paid; 32,000 Parts Bénéficiaires have also been issued.

The financial year ends December 31st.

Companhia Radiotelegrafica Brasileira

Incorporated.—August 14th, 1919.

Head Office.—107, Rua 1º de Marco, Rio de Janeiro.

Directors.—Pedro A. Nolasco Pereira da Cunha, Louis Edgar Sanceau, Dr. Mario de Andrade Ramos, Señor Henrique Lage, Señor Joao Gentil de Mello Araujo, Jack Maurice, Dr. Rodrigo Octavio Filho, and Señor Roberto Cardoso.

President.—Pedro A. Nolasco Pereira da Cunha.

Managing Director.—Louis Edgar Sanceau.

Members of the Fiscal Council.—Dr. Mario de Andrade Ramos, Señor Henrique Lage, Señor Joao Gentil de Mello Araujo.

Members of the Supplementary Council.—Jack Maurice, Dr. Rodrigo Octavio Filho, Señor Roberto Cardoso.

Capital.—Rs.200:000 \$000 (two hundred contos de reis) divided into 2,000 (two thousand) shares of 100\$000 (hundred milreis) each.

The objects of the Company are to exploit the various patents of the Marconi Company and obtain from the Government of Brazil the necessary permission to erect high-power stations for direct communication with Europe and the United States.

Compañía Marconi de Telegrafia Sin Hilos del Río de La Plata

Incorporated.—August 4th, 1906.

Head Office.—Tornquist Building, 132, San Martin, Buenos Aires, Argentina.

Directors.—Captain Guillermo José Nunes (President), Señor Florence O'Driscoll (Managing Director), Colonel Sir Thomas Holdich, K.C.M.G., K.C.I.E., C.B., Godfrey C. Isaacs, Senatore G.

Marconi, G.C.V.O., LL.D., D.Sc., Señor Duncan Munro, Señor J. A. Pilling, Señor Carlos Pereira Pinto, Señor Enrique Schlieper, Sidney F. St. J. Steadman, Señor Antonio Terrarosa.

Secretary.—Enrique Schlieper.

Treasurer.—J. A. Pilling.

Auditor.—Herbert K. James.

Engineer.—E. Berry.

Capital.—\$2,000,000 gold, represented by 250,000 shares of \$5 gold each, series "AA," fully paid, and 150,000 preference shares, 5 per cent. (non-cumulative) of \$5 gold each, series "BB," 35 per cent. has been called up on the "BB" shares. The balance is payable in instalments of 10 per cent. with not less than thirty days' notice. The financial year of the Company ends on May 31st.

The Company owns the Marconi patents and patent rights for the Argentine Republic, and has licences from Marconi's Wireless Telegraph Company, Limited, and the Marconi International Marine Communication Company, Limited, to work the Marconi system in the Republics of Argentina, Uruguay, and Paraguay. The Company has the permission of the Government to erect wireless telegraph stations within the territorial limits of the Argentine Republic and on vessels flying the Argentine flag. The Company is constructing a high-power wireless station in the Argentine Republic to communicate direct with a similar station in Europe.

Compañía Nacional de Telegrafía Sin Hilos

Incorporated.—December 24th, 1910.

Head Office.—Calle de Alcalá, 43, Madrid.

Branch Offices.—Ronda de la Universidad 35, Barcelona; Buenos Aires 13, Bilbao.

Directors.—Excmo. Sr. General Don José de Bascaran; Excmo. Sr. Senatore G. Marconi, G.C.V.O., LL.D., D.Sc.; Godfrey C. Isaacs; Excmo. Sr. Don Antonio Comyn, Conde V. de Abliz; Excmo. Sr. Don José Sanchez Guerra; Sr. Don Eduardo Estelat; Sr. Don Francisco Setuain; Sr. Don Jaime Macnaughtan, Sr. Don José Asensio, and Sr. Don Manuel Moreno Quesada.

Secretary.—Sr. Don José Asensio.

Capital.—6,500,000 pesetas, divided into 8,000 6 per cent. Participating Preference shares of 500 pesetas each, and 5,000 Ordinary shares of 500 pesetas each, all issued and fully paid.

The financial year ends on December 31st.

This Company took over the concession from the Spanish Government for the construction and exploitation of a public wireless telegraph service in Spain and its colonies. The Company has ten wireless telegraph land stations erected and working at Aranjuez, near Madrid, Cadiz, Barcelona, Tenerife, Las Palmas, Vigo, Soller, Finisterre, Santander, and Cape Palos, and has further stations in course of construction. The Company holds an exclusive licence from Marconi's Wireless Telegraph Company, Limited, to use and exploit its patents in Spain and her colonies.

The Company has established a direct wireless telegraph service between Spain and England, and also conducts services with Germany via Aranjuez and Hanover; Austria via Barcelona and Deutsch-Altenburg; Hungary via Barcelona and Budapest; and Italy via Barcelona and Centocelle (Rome).

Drahtloser Übersee-Verkehr A.G. (Transradio)

Founded.—1918.

Head Office.—Berlin S.W.11, Hallesches-Ufer 12/13.

Founded by the Allgemeine Elektrizitätsgesellschaft, Siemens & Halske A.G. and the Gesellschaft für drahtlose Telegraphie m.b.H. (Telefunken), Berlin. The Company was formed to exploit installations for wireless telegraphy and telephony in Germany and other countries.

Directors.—Fritz Ulfers, Karl Solff, Otto Betz (Vice-Director).

The Company has substantial interests in the Transradio, Compañia Radiotelegrafica Argentina S.A., Buenos Aires.

Federal Telegraph Company (The)

Incorporated.—In the State of California, in 1911.

Offices.—Hobart Building, San Francisco, California, and 400, Homer Building, Washington, D.C.

Factory.—Palo Alto, California.

Directors.—R. P. Schwerin, Leon Bocqueraz, Hiram W. Johnson, Jun., Alexander Hamilton, and R. R. Beal.

President.—R. P. Schwerin.

Vice-President.—Leon Bocqueraz.

Secretary.—Augustus Taylor.

Treasurer.—J. E. Godcharles.

Capital.—\$2,500,000; 250,000 shares, par value each \$10.

The Company was formed for the operation of wireless telegraphy and the manufacture of the Poulsen Arc and other wireless sets.

Gesellschaft für Drahtlose Telegraphie m.b.H. (Telefunken)

Incorporated.—June 15th, 1903.

Head Office.—Hallesches Ufer 12/13, Berlin.

Directors.—Count von Arco, Dr. ing. C. Schapira, Fritz Ulfers, Karl Solff (Vice-Director).

Founded by the Allgemeine Elektrizitäts-Gesellschaft, Berlin, and Siemens and Halske A.G., Berlin, for the exploitation of the patents of Professor Slaby, Professor Braun, and Count von Arco all over the world.

The Company, whose shares are in the sole possession of the Allgemeine Elektrizitäts Gesellschaft and Siemens and Halske, Berlin, is interested in the following companies:—

Deutsche Betriebsgesellschaft für drahtlose Telegraphie m.b.H., Berlin, S.W.

Deutsche Südseegesellschaft für drahtlose Telegraphie A. G., Berlin.

Drahtloser Übersee-Verkehr, Aktiengesellschaft (Transradio), Berlin.

Eilvase G.m.b.H., Berlin.

Transradio Compania Radiotelegrafica-Argentina S.A. Buenos Aires.

Atlantic Communication Company, New York.

Telefunken East Asiatic Wireless Telegraph Company, Shanghai.

Independent Wireless Telegraph Company, Inc.

Incorporated.—February 12th, 1919, in the State of Delaware, U.S.A.

Head Office.—42, Broadway, New York City, New York, U.S.A.

European Office.—7, Hobart Place, London, S.W.1, England.

Factory.—Port Chester, New York, U.S.A.

Directors.—P. R. Mallory, C. J. Pannill, F. K. Leatherbee, C. D. Mallory, and J. B. Smull

President.—P. R. Mallory.

Vice-President and General Manager.—C. J. Pannill.

Treasurer.—F. K. Leatherbee.

European Superintendent.—D. J. Heilig.

Capital and Dividends.—Close Corporation.

The Company was formed for the operation of wireless telegraphy and the manufacture of wireless telegraph apparatus.

Marconi International Marine Communication Company, Limited (The

Incorporated.—April 25th, 1900.

Head Office.—Marconi House, Strand, London, W.C.2.

Directors.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc., M.I.E.E., Godfrey C. Isaacs (Managing Director), Alfonso Marconi, Capt. H. Riall Sankey, C.B., C.B.E., R.E. (retired), Henry W. Allen, F.C.I.S., W. W. Bradfield, C.B.E., M. A. Bramston, S. F. St. J. Steadman, Sir Charles J. Stewart, K.B.E., Rt. Hon. Lord Herschell, G.C.V.O., and Lt.-Col. A. Simpson, C.M.G.

Joint General Managers.—W. W. Bradfield, C.B.E., Henry W. Allen, F.C.I.S., and Lt.-Col. A. Simpson, C.M.G.

Assistant General Managers.—G. E. Turnbull and H. W. Corby.

Secretary.—F. Arkin, F.C.I.S.

Marine Superintendent.—Capt. C. V. Daly.

Traffic Manager.—W. R. Cross.

Contract Manager.—A. R. Harding.

Technical Adviser.—Captain J. A. Sloc, C.B.E., R.N.

Capital.—£1,500,000 in shares of £1 each, issued and fully paid £1,192,726. (The capital was increased in May, 1919, by 900,000 shares of £1 each, of which 600,000 were offered to existing shareholders pro rata at par.) 5½ per cent. First Mortgage debentures (bearer)—authorised £250,000, issued £125,000, outstanding £96,380. Secured (without trust deed) as a floating charge on the undertaking and all the property. Redeemable at par, July 1st, 1941. Interest payable, January 1st and July 1st.

Accounts and Dividends.—Accounts are made up to December 31st and usually submitted in June following. The accounts at December 31st, 1919, showed a profit of £340,798 19s. 3d. for the year, and after payment of dividend and reserve for repayment of debentures, £161,890 1s. 3d. was carried forward subject to excess profits duty for 1916, 1917, 1918 and 1919. General Reserve Account £258,013 13s.

Dividends paid, 1910, 5 per cent.; 1911, 7 per cent.; 1912, 10 per cent.; 1913, 10 per cent.; 1914, 10 per cent.; 1915, 12½ per cent.; 1916, 15 per cent.; 1917, 15 per cent.; 1918, 15 per cent.; 1919, 15 per cent.

Last Bearer Coupon paid, No. 17.

This Company was formed for the purpose of working throughout the world, except in the United States of America, Hawaii, Chili, and colonies or dependencies of those States, an exclusive licence for all maritime (being mercantile or yachting) purposes granted by Marconi's Wireless Telegraph Company, Limited. The Company has transferred to Associated Companies its rights in Canada, Argentina, Uruguay, Australasia, and all European countries and their dependencies except the United Kingdom and Italy. This Company owns and operates the wireless telegraph apparatus on about 3,000 vessels of the mercantile marine.

Marconi Scientific Instrument Company, Limited (The)**Incorporated.**—November 1st, 1919.**Registered Office and Works.**—21/25, St. Anne's Court, Dean Street, Soho, London, W.C.**Directors.**—William W. Drury (Managing Director), Henry W. Allan, F.C.I.S., W. W. Bradfield, C.B.E., C. Mitchell, Chas. B. Ward.**Secretary.**—Chas. B. Ward.**Capital.**—Authorised £20,000 in 20,000 shares of £1 each.

The Company was formed to manufacture and sell amateur telegraphic and telephonic apparatus; to manufacture apparatus under licence from Marconi's Wireless Telegraph Company, Limited; to repair and refashion obsolete apparatus, etc.

"Marconi" Societate Anonimă Română Pentru Industria Si Comerțul de Materiale Telegrafice Telefonice Si Electrice**Incorporated.**—April 3rd, 1920.**Temporary address of Head Office.**—Palatul Casei de Credit a Poste, Bucurest.**Directors.**—Senator Guliemo Marconi, G.C.V.O., LL.D., D.Sc. (President), Constantin Olanescu (Vice-President), Maurice Blank, D. D. Burilleau, Al. Tzigara-Samurcas, Constantin Neamtzu, Godfrey Charles Isaacs, Sidney F. St. J. Steadman, Colonel John Ernest Cochrane, D.S.O., Bertram Coryn, Eugen Porn.**Managing Directors.**—Constantin Olanescu, Colonel John Ernest Cochrane, D.S.O., Eugen Porn.**General Manager and Secretary.**—Eugen Craioveanu.**Capital.**—Lei, 6,000,000. 12,000 fully paid-up shares of lei 500 each.

The Company was formed for the manufacture of, and trade in, all kinds of telegraphic and telephonic materials and apparatus, and their installations, wireless and other apparatus, and of industry, trade and installations, and exploitation, in connection with electricity and its application.

Marconi Wireless Telegraph Company of Canada, Limited (The)**Head Office.**—11, Saint Sacrament Street, Montreal, Canada.**President.**—Lieut.-Col. The Hon. Frederic Nicholls.**Vice-Presidents.**—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc., Robert Bickerdike, A. E. Dymont.**Directors.**—Sir William Mackenzie, Godfrey C. Isaacs, G. M. Bosworth, C. G. Greenshields, K.C.**Managing Director.**—A. H. Morse, A.M.I.E.E. (London), Mem.Inst.R.E. (New York).**Manager.**—A. L. W. MacCallum.**Comptroller and Acting Secretary.**—J. P. Fleming.**Traffic Manager.**—G. H. Pearson, Assoc.I.R.E. (New York).**Chief Engineer.**—J. O. G. Cann, M.I.(A).E.E., Mem.Inst.R.E. (New York).**Authorised Capital.**—\$7,500,000 in 3,000,000 shares of \$2.50 each.**Issued Capital.**—2,400,000 shares.

The Company has sole wireless rights under all Marconi and G.E.C. Patents in the Dominions of Canada and Newfoundland. It is the only Company in Canada manufacturing wireless apparatus and providing wireless service. It owns and operates the wireless equipment on nearly two hundred ships of the Canadian and Newfoundland Mercantile Marines, and also owns and operates the duplex, transatlantic, commercial wireless telegraph station at Glace Bay in Nova Scotia.

The Company operates, under contract with the Canadian and Newfoundland Governments, forty wireless stations in the Great Lakes, Gulf of St. Lawrence, and on the Atlantic Coast. It has branch offices in Vancouver, B.C., Winnipeg, Man., Toronto, Ont., St. John, N.B. (winter), and St. John's (Nfld.). It owns and operates Schools of Radiotelegraphy in Montreal, Toronto, and St. John's (Nfld.).

Marconi's Wireless Telegraph Company, Limited**Incorporated.**—July 20th, 1897, as "Wireless Telegraph and Signal Co., Ltd."; name changed as above in March, 1900.**Head Office.**—Marconi House, Strand, London, W.C.2.**Works.**—Chelmsford, Essex.**Directors.**—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc. (Chairman), Godfrey C. Isaacs (Deputy-Chairman and Managing Director), Captain H. Riall Sankey, C.B., C.B.E., R.E. (retired), Samuel Georgebegan, M.I.Mech.E., M.Inst.C.E.I., Alfonso Marconi, W. W. Bradfield, C.B.E., Henry W. Allen, F.C.I.S., M. A. Bramston, S. F. St. J. Steadman, Sir Charles J. Stewart, K.B.E., Rt. Hon. Lord Herschell, G.C.V.O., and Lt.-Col. Adrian Simpson, C.M.G., R.E. (retired).**Joint General Managers.**—W. W. Bradfield, C.B.E., Henry W. Allen, F.C.I.S., and Lt.-Col. Simpson, C.M.G., R.E. (retired).**Assistant General Managers.**—G. E. Turnbull and H. W. Corby, F.C.I.S.**Secretary.**—F. Atkin, F.C.I.S.**Chief Engineer.**—Andrew Gray, M.I.E.E., A.M.Inst.C.E.

The Company was formed to acquire Senatore Marconi's patents for wireless telegraphy in all countries except Italy, its colonies and dependencies, and has since acquired a large number of other patents relating to wireless telegraphy, including those of Sir Oliver Lodge, the General Electric Company of New York (except for America), etc.

It has substantial interests in various subsidiary and affiliated Companies.

The Company conducts public wireless telegraph services, and messages are accepted for transmission, via Marconi, to the United States of America, Canada, Australia, New Zealand, the West Indies, British Guiana, British Honduras, Spain, etc.

Accounts and Dividends.—Accounts and dividends are made up to December 31st, and usually submitted in June following. The Company's accounts at December 31st, 1919, showed shares at cost in Associated Companies and Patents, £1,923,172 10s. 11d. (par value, £2,251,882 4s. 3d.) and General Reserve Account, £1,250,000. The profit for the year was £1,684,526 7s. 1d., and after payment of dividend, £955,202 7s. 1d. was carried forward.

In respect of each of the years 1911, 1912 and 1913, the Company paid dividends of 17 per cent. on the Preference shares and 20 per cent. on the Ordinary shares; in respect of 1914 and 1915, 7 per cent. Preference and 10 per cent. Ordinary dividends were paid; in respect of 1916 the dividends were 12 per cent. on the Preference shares and 15 per cent. on the Ordinary shares; in respect of 1917 the dividends were 17 per cent. on Preference shares and 20 per cent. on the Ordinary shares. For 1918 dividends of 22 per cent. on the Preference shares and 25 per cent. on the Ordinary shares were paid. For 1919 dividends of 22 per cent. on the Preference shares and 25 per cent. on the Ordinary shares were paid, plus a bonus of 5s. per share on both Preference and Ordinary shares.

(Last Bearer Coupons paid: No. 19 Preference, No. 18 Ordinary.)

Capital.—Authorised £3,000,000 in 2,750,000 Ordinary shares of £1 each, and 250,000 Cumulative Participating Preference shares of £1 each. The Preference shares are entitled to a cumulative dividend of 7 per cent., and, after the Ordinary shares have received a 10 per cent. non-cumulative dividend, to share *pari passu* with the latter shares in surplus profits remaining. Issued (November, 1920) 250,000 Preference shares and 2,616,609 Ordinary shares. In November, 1919, the authorised capital was increased by the creation of 1,500,000 Ordinary shares, which were offered in December, 1919, to existing shareholders *pro rata* at a premium of £2 per share. The shares thus created rank for dividends declared in respect of the period commencing January 1st, 1920.

Nederlandsche Seintoestellen Fabriek

Incorporated.—February 27th, 1918.

Head Office and Works.—Groest 104/106, Hilversum, Holland.

Directors.—Bern E. Ruys (President), D. Hudig L. Jzn (Commissaire Délégué), A. J. M. Goudriaan, J. H. Hummel, A. E. J. Bertling, A. Veder, G. C. Isaacs, G. E. Turnbull.

Manager.—A. Dubois.

Capital.—2,000,000 florins, divided into 2,000 shares of 1,000 florins each.

The financial year ends December 31st.

The Company was formed for the purpose of exploiting a factory or factories for the manufacture of installations, apparatus and tools destined for or relating to wireless telegraphy, telephony, signalling apparatus, etc., and trading in the above-mentioned apparatus. It has entered into an agreement with Marconi's Wireless Telegraph Company, Limited, whereby the latter Company grants to the N.S.F. the exclusive right to manufacture and sell in Holland and the Dutch Colonies wireless material according to its Patents and designs, present and future.

Nederlandsche Telegraaf Maatschappij, "Radio-Holland"

Incorporated.—December 6th, 1916.

Head Office.—562 Keizersgracht, Amsterdam.

Directors.—J. B. A. Jonckheer (President), D. Hudig L. Jzn (Vice-President), J. Rypperda Wierdsma, A. J. M. Goudriaan, J. Wilmink, P. J. Roosegaarde Bisschop, H. Colyn, Prof. C. L. van der Blit, Senatore G. Marconi, Godfrey C. Isaacs, Maurice Travailleux, Gaston Périet.

Managing Director.—L. H. F. Wackers.

Administrator, Dutch East Indies.—Th. P. van den Bergh.

Capital.—3,000,000 florins, divided into 3,000 shares of 1,000 florins each, of which 2,000 shares have been issued and fully paid.

The financial year ends at December 31st.

The Company was formed for the purpose of the establishment, sale, hire, control and exploitation of wireless telegraph and wireless telephone stations on vessels of the mercantile marine of Holland and its colonies.

Norsk Marconikompani Aktieselskap

Constituted.—November 28th, 1918.

Head Office.—Nygaten 2B, Christiania.

Capital.—1,250,000 Kroner, divided into 1,250 registered shares of Kroner 1,000 each.

Directors.—Consul-General O. J. Storm (Chairman), Commander J. Bull, Godfrey C. Isaacs, Maurice Travailleux, Otto Thoresen.

Deputy-Directors.—Commander B. L. Gottwaldt, E. S. Skottun, and A. Hubert.

Technical Manager.—Commander B. L. Gottwaldt.

Commercial Managers.—Messrs. Storm and Bull, Ltd., Christiania.

This Company was constituted for the manufacture, sale, and rental of apparatus for Wireless Telegraphy, Telephony, Signalling, etc., and other business in connection therewith. It has acquired the Marconi patent rights, present and future, for use in Norway.

Pan-American Wireless Telegraph and Telephone Company (The)

Incorporated.—State of Delaware, U.S.A. Amended Certificate of Incorporation, October 18th, 1917.

Office.—233, Broadway, New York City.

Directors.—Hon. John W. Griggs, Edward J. Nally, James R. Sheffield, David Sarnoff, Edward W. Harden, Albert G. Davis, C. B. Coady, R. Mainzer, R. P. Schwerin.

Chairman.—Hon. J. W. Griggs.

President and General Manager.—Edward J. Nally.

Vice-President and Commercial Manager.—David Sarnoff.

Secretary.—Charles J. Ross.

Treasurer.—George S. De Sousa.

Capital.—3,500 shares 7 per cent. preferred stock of \$100 each, cumulative after January 1st, 1921; 50,000 shares common stock, no par value. The financial year ends December 31st.

The Company has the exclusive right and licence to use the Marconi and Poulsen Patents for the sole purpose of radio or wireless communication between the United States of America and all countries of South America, Central America, Mexico, the Islands of Cuba, Porto Rico, and the West Indies.

Radio Communication Company, Limited

Incorporated.—March 14th, 1919.

Head Office.—34/35, Norfolk Street, London, W.C.2.

Directors.—T. W. Stratford-Andrews (Chairman), Sir Wm. R. Brooke, K.C.I.E., J. Herbert Scrutton, B. Binyon, O.B.E. (Managing Director).

Secretary.—E. A. B. Snoaden.

Capital.—£200,000, divided into 100,000 6 per cent. Cumulative Participating Preference shares and 100,000 Ordinary shares. Issued: 79,502 Ordinary and 65,500 Preference.

The Company was formed under the aegis of the Indo-European Telegraph Company, Limited, for the manufacture, sale and operation of radio apparatus, including "Polar" radio equipment for ships.

Radio Corporation of America

Incorporated.—October 17th, 1919, in the State of Delaware.

New York Office.—Woolworth Building, 233, Broadway, New York City.

Directors.—Owen D. Young (Chairman), E. J. Nally (President), E. W. Rice, Jun., Hon. John W. Griggs (General Counsel), James R. Sheffield, A. G. Davis, Gordon Abbott, Edward W. Harden, F. A. Stevenson, and W. S. Gifford.

Secretary and Comptroller.—Charles J. Ross.

Treasurer.—George S. de Sousa.

Capital.—Authorised: \$25,000,000 Preferred Stock in 5,000,000 shares of \$5 each. There are also 5,000,000 Common shares of no par value. Issued: \$10,675,870 in 2,135,174 Preferred shares of \$5 each, fully paid. 4,030,000 Common shares of no par value. Rights: The Preferred Stock is entitled to receive dividends of 7 per cent. per annum and no more. In any distribution of the assets it is entitled to be paid off at par, prior to any payment to the Common shareholders. The Preferred dividends are cumulative after the fiscal year ending in or with the calendar year 1923, and the Preferred Stock may be retired on any day on which a dividend thereon shall be payable, at \$5.50 per share and accrued dividends.

The Company was formed to acquire certain assets of The Marconi Wireless Telegraph Company of America and all wireless inventions, present and future, of the General Electric Company of New York.

R.M. Radio Limited

Registered.—September 6th, 1919.

Head Office.—5, Chancery Lane, London, W.C.2.

Engineers' Offices and Show-Rooms.—18 and 19, Whitefriars Street, E.C.4.

Directors.—H. R. Rivers-Moore, W. H. Merriman, H. de A. Donisthorpe, L. J. Graham, A. G. Ionides, A. E. Snape.

Secretary.—G. Horswell.

Capital.—£10,000.

The Company was formed for the purpose of constructing, supplying, maintaining and operating radiotelegraphic and telephonic apparatus of all kinds for the purpose of intercommunication on land, at sea, and in the air.

Russian Company of Wireless Telegraphs and Telephones (The)

Incorporated.—October 8th, 1908.

Head Office.—14, Lopouchinskaja, Petrograd, Russia.

Directors.—Senator G. Marconi, G.C.V.O., LL.D., D.Sc., G. C. Isaacs, S. M. Eisenstein, Pierre de Balinski, M. Salberg, Lt.-Col. Adrian Simpson, C.M.G., R.E. (Managing Director), Admiral I. F. Bostrem, I.R.N. (retired), L. M. Eisenstein (Deputy Director).

Secretary.—Leon Eisenstein.

Capital.—Originally 1,200,000 roubles in 12,000 shares of 100 roubles each. This capital was

increased to 1,800,000 roubles in November, 1911, in order to enable the Company to acquire a licence from Marconi's Wireless Telegraph Company, Limited. The capital was further increased in 1913 to 2,400,000 roubles, and in 1914 to 3,000,000 roubles, divided into 30,000 shares of 100 roubles each.

The financial year ends December 31st (Russian date).

Dividends.—In respect of the years 1912 and 1913 dividends of 6 per cent. have been paid and 15 per cent. in respect of 1914 and 1915, and 17 per cent. for 1916.

The Company owns the Russian patents taken out in the name of S. M. Eisenstein, and also holds an exclusive licence to use and exploit the Marconi Company's patents in Russia (excluding stations for international communication or on vessels of Russian Mercantile Marine).

(N.B.—Owing to the political situation in Russia it has not been possible to revise the particulars concerning the above Company.)

Société Anonyme Internationale de Télégraphie Sans Fil

Incorporated.—March 31st, 1913.

Head Office.—13, Rue Bréderode, Brussels.

Capital.—4,500,000 francs, divided into 9,000 shares of 500 francs each, all issued; 4,500 shares are fully paid, and the remaining 4,500 shares are 100 francs paid.

The last dividend paid was 15 per cent. for the year 1919.

The financial year ends at December 31st.

The Company exploits wireless telegraphy on vessels of the mercantile marine of all European countries excepting the United Kingdom of Great Britain and Ireland, Germany, Austria-Hungary Italy and France, and at the present time owns and operates wireless telegraph apparatus on nearly 600 vessels.

Société Française Radio-Electrique, Société Anonyme

Incorporated.—April 4th, 1910.

Head Office.—79, Boulevard Haussmann, Paris.

Laboratory.—Suresnes (Seine), 51, Rue Carnot.

Works.—Levallois-Perret (Seine), 2, Quai Michelet.

Big Machine Works.—Belfort: Société Alsacienne de Constructions Mécaniques.

Tower and Pillar Works.—Venissieux (Rhône), 72, Chemin du Moulin à Vent à Parilly.

Chairman.—M. Henri Bousquet.

Vice-Chairman.—M. G. Ferrand.

Financial Director.—M. A. Fondère.

Managing Director.—M. E. Girardeau.

Directors.—Comte de Beaumont, Baron de La Chevrelière, P. Desachy, A. Dupont, N. Pietri, O. de Rivaud.

Technical Manager.—Major P. Brenot.

Technical Advisers.—MM. Bethenod, Latour, Boucherot, De Bellescize, Petit.

Capital.—7,000,000 francs, divided into 70,000 shares of 100 francs each, all issued and paid up.

The Company manufactures wireless telegraph apparatus and engines, and erects wireless stations, and also owns and operates the patents of MM. J. Bethenod, E. Girardeau, M. Latour, etc.

It exploits chiefly that system of wireless telegraphy which employs high-frequency machines, the system adopted for all the great stations of France and its Colonies and by various other Governments.

Société Indépendante Belge de Télégraphie Sans Fil, Société Anonyme

Incorporated.—January 29th, 1920.

Head Office.—23, Boulevard de Waterloo, Brussels.

Directors.—M. le Baron Henri Lambert (President), MM. Braillard (Managing Director), Decorat Vanderhaeghen, Van Halteren.

Manager.—M. Jamotte.

Capital.—1,000,000 francs, divided into 2,000 shares of 500 francs each.

Spanish and General Corporation (The), Limited

Incorporated.—April 19th, 1920.

Head Office.—Marconi House, Strand, London, W.C.2.

Directors.—Godfrey C. Isaacs (Chairman and Managing Director), Alfonso Marconi, Captain H. Riall Sankey, C.B., C.B.E., R.E. (retired), S. F. St. J. Steadman, Lt.-Col. C. E. P. Sankey, D.S.O., R.E. (retired).

Joint Secretaries.—F. Atkin, F.C.I.S., A. S. Birch.

Capital.—Authorized, £500,000 in 500,000 shares of £1 each. Issued (November, 1920) 342,587 shares of £1 each. The Company was formed to take over the liabilities and assets of the Spanish

and General Wireless Trust, Limited, and, in addition to carrying on the business of that Company, to transact generally the business of a Financial Corporation.

Shareholders of the Spanish and General Wireless Trust, Limited, were offered one share of the Corporation in respect of every share of the Trust held by them.

Wireless Speciality Apparatus Company

Incorporated.—June 14th, 1907, New York.

Head Office.—131, State Street, Boston, Massachusetts, U.S.A.

Directors.—George S. Davis, William Newsome, Eugene W. Ong, Philip Farnsworth, Greenleaf W. Pickard, Herbert R. Jenney, Victor M. Cutter.

President.—George S. Davis.

Vice-President.—William Newsome.

Secretary.—John L. Warren.

Chief Engineer.—William H. Priess.

Capital.—\$700,000.

The fiscal year ends December 31st of each year.

The Company is engaged in the manufacture of radio apparatus exclusively, and has the exclusive rights to the patents of Professor Greenleaf Whittier Pickard, the inventor of the so-called "Crystal Detectors" and the radio "Pelorus," sometimes called radio direction finder.

BIOGRAPHICAL S E C T I O N

(A) Biographies.

(B) Obituary Notices.

BIOGRAPHICAL NOTICES

Abraham, Henri.—General Secretary of the Société Française de Physique, 1901 to 1913, now Professor of Physics at the Sorbonne in Paris.

Alexanderson, Ernst Fredrik Werner.—Chief Engineer, Radio Corporation of America. B. Upsala, Sweden, January 25th, 1878. Educ. at the High School and University of Lund, Sweden, and at the Royal Institute of Technology, Stockholm, completing a post-graduate course at Berlin. Entered the service of the C. and O. Electric Company, 1901. Joined the General Electric Company, 1902. Occupies the post of consulting engineer to the latter concern. Introduced iron into the manufacture of high frequency circuits, and originated the development of 2, 50 and 200 kw. radio frequency alternators and the magnetic amplifier. The first 200 kw. radio frequency alternator and magnetic amplifier for radiotelegraphic work designed by Mr. Alexanderson was installed in the Marconi Company's station at New Brunswick, N.J., and has now been adopted by the Radio Corporation of America for all of its high power stations. Also developed the "barage" receiver and kindred inventions. Has carried on notable pioneer work in duplex radio telephony. Holds a number of United States patents. Member of the American Institute of Electrical Engineers. Fellow of the Institute of Radio Engineers. Author of over twenty scientific papers read before various technical societies. Address: Woolworth Building, New York.

Allen, Henry W., F.C.I.S. (1902). Joint General Manager, Marconi's Wireless Telegraph Company, Ltd., and Marconi International Intercommunication Company, Ltd. (1919). B. 1870. Met Senatore Marconi, 1896. Assisted (1897) in formation of the Wireless Telegraph and Signal Co., Ltd., afterwards becoming secretary to that company. Secretary of Marconi International Marine Communication Co., Ltd., and Assistant Manager of Marconi's Wireless Telegraph Co., Ltd. (1900). Deputy Manager, Marconi's Wireless Telegraph Co., Ltd. (1910). Elected to a seat on the Board of each company, 1917.

Appleby, Thomas.—B. May 10th, 1886, near Newcastle-on-Tyne, England. Arrived in America, 1888. Commenced wireless experiments, 1899. Went to sea, 1909, as radio operator. September, 1909, in charge of United Wireless Station at Atlantic City, N.J. April, 1912, in charge of Wanamaker-Marconi Service between New York and Philadelphia Wanamaker Stores. April 9th, 1917, commissioned in the U.S. Navy as a Lieutenant (J.G.) for Radio Engineering. Ordered to the Office of the Director of Naval Communications, Navy Department, Washington, D.C. Author of U.S. "Wartime Radio Instructions for Merchant Vessels." Spring of 1918, established shore radio compass stations for the detection and location of enemy vessels in West Atlantic. Selected the sites and supervised the erection, installation and calibration of shore radio compass stations erected on Atlantic coast of United States from Cross Island, Maine, to

Gulf of Mexico. Spring of 1919, selected sites for shore radio compass stations on the Pacific Coast of the United States. April 24th, 1919, promoted Senior Lieutenant, U.S. Navy. August 7th, 1919, released from active duty, U.S. Navy. August 8th, 1919, Radio Engineer in the Office of the Director of Naval Communications and given entire charge of all shore radio compass stations in the United States. November 15th, 1919, resigned from Navy Department to enter profession of Patent Lawyer. Full Member of the Institute of Radio Engineers, New York. Address: 5847, Ellsworth Street, Philadelphia, Pa., U.S.A.

Appleton, Edward Victor, M.A. (Cantab.), M.Sc. (Lond.), Fellow of St. John's College, Cambridge. B. Bradford, 1892. Educ. St. John's College, Cambridge. First-class Honours in National Science Tripos, Parts I. and II. (Physics). Served European War, 1914-1919, as Captain W.T. R.E. Specially interested in Thermionic Valves. Engaged in Valve Research, Cavendish Laboratory, Cambridge. Member of Thermionic Valve Sub-Committee, Radio Research Board, Department of Scientific and Industrial Research. Address: St. John's College, Cambridge.

Arco, Graf Georg von.—B. Grossgorschütz, Germany. Educ. at Berlin University and Technical High School, Charlottenburg. Assistant to the late Professor Slaby in the department of wireless telegraphy, 1898; later joined the Allgemeine Elektrizitäts Gesellschaft, Berlin, continuing at the same time his work on the Slaby-Arco system of wireless telegraphy. Manager of the Gesellschaft für Drahtlose Telegraphie, 1903. Carried out practical wireless telephony over a distance of 35 km. (21.7 miles), 1906. Exhibited high frequency alternator with static frequency step-up transformers at the International Radiotelegraph Congress in London, 1912. This arrangement is now used in the high power-station of Nauen, generating 400 kw. in the aerial and used for telegraphy and telephony. Address: Tempelhof, Berlin, Albrechtstrasse 49/50.

Armstrong, Edwin H., Professor at Columbia University and President of the Radio Club of America. B. in U.S.A., December 18th, 1890. Graduated at Columbia University in 1913. Has undertaken radiotelegraphic work in conjunction with Professor Pupin at the Columbia Laboratories. He is himself a director of the Institute of Radio Engineers, and was recently awarded the medal of the Institute. Served two years in A.E.F. as Captain and Major in the Signal Corps. Decoration: Chevalier Légion d'Honneur. Present address: Columbia University, New York City.

Asano, Dr. Osuke.—B. 1859. Graduated at the Engineering College of the Tokyo Imperial University, 1881. Honorary Professor, Tokyo University. Director of the Electro-Technical Laboratory of the Department of Communications, 1897. Retired, 1919. Took many trips to Europe and America, first for the investigation of electrical engineering; second as a Japanese delegate of the International Wireless

Telegraph Conference, Berlin, 1906; and third as a Japanese delegate of the International Conference on Electrical Units and Standards, London, 1908. Pioneer of wireless investigation in Japan, and his investigation has continued since 1897. The so-called "Teishinsho" wireless system is due to his investigations. Laid the submarine cable between Formosa and Osumi in 1895-97, the first long-distance submarine cable ever laid by a Japanese at that time. Raised to the rank of Dr. Engineer, 1899. Supervises all electrical works in Japan. Awarded 2nd Order of Merit, 1914.

Asin, Don Humberto de, Engineer-in-Chief of the Radiotelegraph Service of Bolivia. Studied electricity at the University of Santiago. Chief of important technical sections, railways of Guayaquil y Arica at La Paz. Studied radiotelegraphy. Visited San Cristobal, Lima, the School of Santiago, and the two installations which were then at the Docks, Buenos Aires. Commissioned by Bolivian Government to visit Europe. Graduated as radiotelegraphist at the Marconi Company's professional school at Broomfield. Visited Germany to study the Broomfield system. Installed six stations in Bolivia and will instal Trinidad, Cobija, Villa Bella, Concepción, Magdalena, San Ignacio, Puerto Suárez, Santa Cruz, Todos Santos, and many more.

Athanasiadis, Capt. C.—B. Athens, 1878. Educ. Royal Naval College, 1892. Commissioned in the Navy, 1896, and after eleven years' active service became interested in wireless telegraphy. Supervised the erection of the first wireless installations in Greece. Sent to London, 1909, by his Government as the head of a mission for the construction of Greek wireless stations. Remained in England for a year and a half, and during that period came into close contact with the Marconi organisation. On his return to Greece he was appointed head of the Radio Telegraph Service of the Navy, a position which he still holds. Author of the standard Greek instructional books in wireless, and has achieved some successes in the realms of poetry and the drama. Address: 45, Nikis Str., Athens.

Austin, Louis Winslow, Ph.D.—Head of the U.S. Naval Radiotelegraphic Laboratory, Washington, D.C., since 1908. Son of Professor L. A. Austin, of Middlebury College. Educ. Middlebury College, Clark University, and the Universities of Strassburg and Berlin. Assistant professor of physics at the University of Wisconsin, then joined the staff of the Physikalisch-Technische Reichsanstalt, Berlin. Dr. Austin is especially interested in quantitative high-frequency measurements. Delegate to the London International Radiotelegraphic Conference. President of the Institute of Radio Engineers, 1914. Address: Radio Building, Bureau of Standards, Washington, D.C.

Ballantine, Stuart.—B. September 22nd, 1897, Philadelphia, Pa. Educ. Philadelphia Public Schools, studied mathematics at Drexel Institute. Engaged in electro-chemical research, H. K. Mulford Company, 1916: and telephone engineer, Bell Telephone Company, 1916-17. Took up development of radio compass for U.S. Navy Department, and was in charge of this work from 1917-20. At present pursuing special studies in mathematical physics at Harvard University. Address: 15, Sumner Road, Cambridge, Mass., U.S.A.

Ballantyne, Hon. Charles Colquhoun.—Minister of Marine and Fisheries, and Minister of the Naval Service of Canada. B. August, 9th, 1867,

Dundas County, Ontario. Educ. local Public School and Commercial College, Montreal. He has been connected with the Militia for many years, and raised a battalion of the Grenadier Guards of Canada for overseas service, 1916. Member of the Montreal Harbour Commissioners. Privy Councillor, October 3rd, 1917. Minister of Public Works. Resigned that portfolio. Minister of Marine and Fisheries and Minister of the Naval Service, October 13th, 1917. Elected to the House of Commons for the St. Lawrence-St. George Division of Montreal, 1917. Independent in politics. Member of the Presbyterian Church. Member of the Mount Royal, St. James, Canada, Forest and Stream, Jockey and Hunt Clubs, Montreal, and of the Rideau Club, Ottawa. Addresses: Ottawa and Montreal.

Bangay, Raymond D.—B. Lyme Regis, 1883. Educ. Epsom College and Finsbury Technical College. Joined the Marconi Company, 1902. Spent five years in America, during which time was engaged in different branches of the Service. Returned to England and studied Military Wireless Stations. Chief of the Field Station Department, Marconi's Wireless Telegraph Co., Ltd., 1914. Author of "The Elementary Principles of Wireless Telegraphy," and "The Oscillation Valve." Address: Gresham Cottage, Brentwood, Essex.

Beggerow, Dr. Hans.—Admiralty Counsellor since June, 1914. B. September 30th, 1874. Educ. University of Berlin, and Freiburg-in-Breisgau, where he obtained his Doctorate. From 1901 till 1919 chief expert adviser to the German Admiralty in all matters concerning wireless telegraphy. Similar position in the Prussian Army, 1906-14. Retired November, 1919. Address: Berlin, W.15, Meierottstr. 3.

Bellini, Dr. Ettore.—B. Foligno, Italy, April 13th, 1876. Educ. Naples University. Electrical Engineer to the Royal Italian Navy, 1901. Chief of the Naval Electrical Laboratory at Venice, 1906. Responsible for carrying out research work dealing with the employment of wireless telegraphy on warships and submarines. Joint inventor with Capt. Tosi, of the Radiogoniometer, an apparatus for directive wireless telegraphy.

Bethenod, J. F. J.—Consulting Engineer to the French Société Radio-Electrique. B. Lyons, 1883. Educ. Central School of that city. For a number of years acted as the Assistant of Professor André Blondel. From 1903 onward, published a large number of theoretical articles on Electro-Dynamic Machinery, and has entered into business relationship with a number of Constructional Engineering Houses for the exploitation of his inventions. After a term of military service in the Engineers, specialised in wireless telegraphy. In this field, both scientific investigation and industrial practice owe several important contributions to his activities. A number of wireless stations of varying power have been installed, wherein his devices are utilised. Of recent years, M. Bethenod has turned his attention to high-frequency alternators, and has built machines giving remarkable results.

Bhering, Francisco. Professor of Geodesy and Astronomy in the Polytechnic School of Rio de Janeiro. Director of the Technical Branch of the Telegraphic Administration. B. Uberaba, State of Minas Geraes, Brazil, January 1st, 1867. Under his initiation and supervision survey and mapping of Brazil undertaken in unified maps on the scale of one millimetre per kilometre. Represented Brazil as delegate at the Inter-

national Telegraphic Conference of 1903, at the Radiotelegraphic Conference, London, in 1912, and at the Time Conference, 1912. Member of the mixed Civil and Military Commission organised to deal with wireless matters. Author of a number of works on civil engineering, geography, and telegraphy. Address: Rua Conde Irajá No. 111, Rio de Janeiro, Brazil.

Bjarnov, Alexander William.—Telegraph engineer, cand.-polyt., Eng.-in-Chief of the Danish Telegraph Dept.'s Third Engineering District; Fellow of Danish Engineers' Ass. and of the Electrotechnic Association (Elektroteknisk Forening); member of the Board from 1911 to 1919; Associate of the American Scandinavian Foundation. B. Copenhagen, 1874. Studied Polytechnic Academy, Copenhagen. Attached to the Telegraph Dept. since 1903. Passed through the Naval and Torpedo Department Spark Telegraph School for Officers in 1907. Since 1909, together with Helmuth Schledermann, has supervised the examination of wireless operators and the inspection of wireless stations on board ships flying the Danish flag. Address: Gl. Kongevej 96, Copenhagen V.

Bjoerkman, S. O. V.—B. 1883. Since 1911 Superintendent of the Wireless Station at Nya Varvet, near Gothenburg, Sweden. Address: Nordhemsgatan 33, Gothenburg.

Blandy, Col. Lyster Pettipiece, D.S.O.—Controller of Communications at the Air Ministry; Officer of the Legion of Honour; Chevalier of the Order of the Crown of Belgium; Mons Star with bar; General Service and Victory Medals; Croix de Guerre of Belgium. B. September 21st, 1874. Educ. Haileybury College and Royal Military Academy, Woolwich. Entered Royal Engineers, March, 1895; Captain, 1904; Major, 1914. From 1908–12 Inspector Royal Engineers Stores at Woolwich, during which period he had much to do with Army Field Wireless Sets. In the start of 1913 took over command of a small unit of thirty to forty men, the Wireless Signal Company. In charge of Wireless personnel in the British Expeditionary Force 1917. From 1914–17 in charge of Wireless Communication of the B.E.F., France. Became Chief Experimental Officer of Army Signals Experimental Establishment, July, 1917. Chief Experimental Officer, R.A.F., April, 1918, and thence transferred to present post. Address: Naval and Military Club, London.

Blondel, André E.—B. Chaumont, France, 1863. Graduated at Paris University. Contributor to learned societies and technical journals on several subjects, including wireless telegraphy. Invented (1893) a new apparatus, which is known as the "Oscillograph," and which opened a fresh field for the study of alternate currents. Was the first to explain, mathematically (1893), the effect of inertia in the hunting of alternators. Among his other activities in wireless telegraph, mention should be made of directed waves produced by a double aerial oscillating on the fifth harmonic, and also of a system of acoustically syntonic wireless telegraphy.

Blondlot, Professor Prosper René.—B. Nancy, 1849. After completing his scientific studies in Paris, returned to Nancy. Became Professor at the Faculty of Sciences. Now Hon. Professor and Correspondent of the Institute of France. Devoted considerable study to the problem of electromagnetic waves, the main object of his researches being to determine the speed of propagation of such waves. In 1891 he found

for this speed the value 302,200 km. per second, and, in 1893, by another and quite different method, the value 297,200 km. per second. Has also investigated the laws of propagation of wireless waves in various media.

Bradfield, William Walter, C.B.E.—Joint General Manager, Marconi's Wireless Telegraph Company, Ltd., and Marconi International Intercommunication Company, Ltd. B. London, 1879. Entered the Wireless Telegraph and Signal Co., Ltd., 1897. Electrical assistant to Senatore Marconi all through the course of the latter's experimental work in Radiotelegraphy on Salisbury Plain during 1897. Installed the first wireless apparatus on British battleships, 1899, and a little later assisted in demonstrations to the United States Government on board the United States battleship "Massachusetts." In 1901 similar demonstrations conducted by him for the French Government resulted in the establishment of wireless communication between the French Riviera and Corsica. Supervised in 1901 the erection of the well-known station at Siasconset and the Nantucket Lightship. Chief Engineer to the Marconi Wireless Telegraph Co. of America, 1902. Deputy Manager of the Marconi's Wireless Telegraph Company, and of the Marconi International Marine Communication Co., Ltd. Manager of both concerns, 1910. Elected to the Board of the two companies, 1917. Address: 1, St. James's Place, London, S.W.

Brailard, Raymond, General Manager, Société Indépendante Belge de Télégraphie sans Fil. B. 1888, Dept. of Jura, France. Studied engineering at the Ecole des Arts et Métiers, Cluny, and Ecole Supérieure d'Electricité, Paris. Served two years in the electrical industry. Military service at the Eiffel Tower Wireless Station. Engineer of the Société Française Radio Electrique. Visited Belgian Congo (1911) as Chief Engineer of Wireless Telegraphy. Installed the network of Congolese Stations. Before the war installed the powerful station at Laeken, near Brussels. Secretary of the International Commission on Scientific Wireless Telegraphy. During the war attached first to the Wireless Service of the Belgian Army, then to the Wireless Station at Croix d'Hins (Bordeaux). Author of several scientific papers. Address: 23, Boulevard de Waterloo, Brussels.

Branly, Edouard.—B. Amiens, October 23rd, 1844. Educ. St. Quentin College and Henry IV College, Paris. Fellow of the University, Doctor of Physical Science, and Doctor of Medicine. Some of his works relate to the electrical conductivity of radio-conductors. International Jury of Superior Precept Instruction awarded him (1900) *grand prix* for his exhibition of radio-conductors. French Minister of Public Instruction made him an Officer of the Legion of Honour in recognition of the part he had played in connection with the discovery of "Wireless Telegraphy." Has constructed various independent distributing apparatus for producing telemechanical effects without wires. Elected a member of the Academy of Science, Paris, January, 1911.

Brenot, Commandant Paul.—B. Ruoms, Ardèche, September 19th, 1880. Educ. Ecole Polytechnique. Transferred to the Central Establishment of Radiotelegraphy, and supervised the installation of wireless at most of the military stations, both permanent and mobile. Represented wireless telegraphy at the International Electrical Congress at Marseilles, 1908, and later on collaborated with M. Blondel in various investigations into the employment of

aircraft for radiogoniometry and high on arcs for wireless telegraphy and tele-
 ly. Carried through some important experi-
 on the employment of wireless telegraphy
 aircraft, 1910-11, which gained for their
 ator the Cross of the Legion of Honour.
 re the war, head of the practical work in
 dvanced wireless school. Technical adviser
 ne Minister of the Colonies, 1911, and took
 the organisation of the Colonial systems,
 ularly those applying to communication
 en the various Colonial units. Delegate
 e Colonial Office at the International Radio-
 graphic Conference, London, 1912; at the
 national Time Conference, Paris, 1912-13;
 at the International Safety-at-Sea Con-
 ce, London, 1913-14. During the war,
 t remaining in charge of French Colonial
 ss, appointed head of the Radiotelegraphic
 e at Paris and of the Eiffel Tower Station.
 Army, 1919. Became Technical Manager
 e Société Française Radio-Électrique and
 lting Engineer to the Compagnie Générale
 légraphie sans Fil.

ght, Sir Charles, F.R.S.E., M.Inst.C.E.,
 e.S., M.I.Mech.E., M.I.E.E., F.I.Radio.E.,
 .S., F.S.S.—B. London, 1863. Educ.
 ng College and King's College. Engineer and
 ician for the construction, testing, laying
 pairing of over 25,000 miles of submarine
 Gave special expert evidence before
 Departmental Cables Communication
 mtee (1902), House of Commons Radio-
 aphic Committee (1907), and Dominions
 Commission (1911). Member of R.F.C.
 Enquiry Committee (1916), and of British
 ation War and Engineering Committee
 . Contributed papers, addresses and lec-
 o numerous learned societies. Author of
 s standard works, notably "Submarine
 aphs," "The Story of the Atlantic
 " "The Administration of Imperial Tele-
 " and "Telegraphy, Aeronautics and
 Represented Australia as sole delegate
 International Radiotelegraphic Conference
 Vice-President, Wireless Society of
 n and Institute of Aeronautical Engineers.
 es: Leigh Grange, Tonbridge, and
 eum Club, Pall Mall, London, S.W.1.

yn, Frank James, C.B.E., M.A., B.Sc.—
 5 near York. Educ. privately. Grad.
 a University (Honours and Prizeman).
 d the Higher Division of the Civil Service,
 Appointed to the Post Office. Principal
 1910. Assistan Secretary in charge of
 phs, March, 1919. Member of British
 Delegation, 1919, in capacity of expert
 on telegraph questions. Post Office
 ntative on Imperial Communications
 tee, and Member of Wireless Telegraph
 mtee of that Committee. Member of
 Wireless Telegraphy Committee ap-
 y Government in 1919 to formulate a
 of W/T for the Empire. Senior British
 e to Conference at Washington on Tele-
 communications, 1920. Address: G.P.O.,

n, Sidney George, M.I.E.E.—B. 1873,
 U.S.A., of English parents, and brought
 up when eighteen months old. Educ.
 ate and London University. Made a
 study of submarine telegraphy and is
 of the magnifying cable relay. Invented
 n cable relay and the magnetic shunt,
 since that date he has also devoted
 ntention to telephony and wireless tele-
 and has achieved some important
 such as the carbon telephone relay,
 e transmission on land trunk lines, the

improved wireless telephone receiver, and other
 inventions. Vice-President of the Wireless
 Society of London.

Bucher, Elmer E.—B. Akron, Ohio, November
 11th, 1885. Educ. Academy Oberlin, Ohio.
 Joined the De Forest Wireless Telegraph Com-
 pany as experimental engineer, 1903. Con-
 structed several high-power stations in the
 Middle West and on the Gulf Coast for this
 firm. Joined the United Wireless Telegraph
 Company as installation and experimental
 engineer, 1907. Installed the first ship stations
 of the United States Navy. Organised the
 United Wireless Telegraph Company's School,
 1909. Instructing engineer and chief inspector
 of that company for more than two years.
 Associated himself with the Y.M.C.A., New
 York, in the initiation of wireless schools, 1910.
 Joined the Marconi Wireless Telegraph Company
 of America as instructing engineer, 1912. Or-
 ganised Marconi Institute, 1917, and acted in
 capacity of Director. Joined Commercial De-
 partment, Radio Corporation of America, 1920.
 Devoted many years to experimental long-
 distance wireless work and holds a large number
 of U.S. wireless patents. Held position as
 Technical Editor of "Wireless Age" during the
 period 1913-18. Author of "Practical Wireless
 Telegraphy," "Vacuum Tubes in Wireless
 Communication," "Wireless Experimenters'
 Manual," and other works. Member of the
 Institute of Radio Engineers.

Bullard, Rear-Admiral W. H. G., U.S.N.—B.
 December 6th, 1866, State of Pennsylvania,
 U.S.A. Graduated, United States Naval
 Academy, 1886. Served on ships of the Navy
 on the Atlantic, South Atlantic, Pacific and
 Asiatic Stations, with shore duty, with particu-
 lar reference to the science of Electrical Engineer-
 ing, in which he had specialised. First Superin-
 tendent of the Naval Radio Service, 1912-16.
 Under his supervision the communication
 system of the Navy Department was developed
 and enlarged. Delegate-plenipotentiary of the
 United States at the International Conference
 for Safety of Life at Sea, London, November,
 1913. In charge, on behalf of the United
 States Navy, of the wireless operations con-
 tained in the series of experiments carried out
 between the Eiffel Tower and Arlington to
 determine longitude by means of wireless tele-
 graphy. During the World War his sea service
 was in the Sixth Battle Squadron of the British
 Grand Fleet, serving in the North Sea. After
 the war he returned to Washington in charge
 of the Communication Service of the Navy
 Department, with the title "Director Naval
 Communications," the former Radio Service
 having been enlarged to include all forms of
 communication.

Burstyn, Dr. W.—B. Austria, 1877. Educ.
 Vienna University. Started his career as
 electrical engineer with the Siemens-Schuckert
 Werke, Charlottenburg. Later engineer with
 Gesellschaft für Drahtlose Telegraphie. De-
 veloped together with Baron Lepel (1907-12)
 the quenched spark system. Now at Physics
 and Technical Laboratory and is *privatdozent*
 for wireless telegraphy and electric clinics,
 Technical High School, Charlottenburg. Ad-
 dress: Berlin—Wilmsdorf, Prinzregenten-
 strasse 23.

Carpentier, Jules.—Member of the Académie
 des Sciences, Bureau des Longitudes, Com-
 mander of the Legion of Honour, President of
 the Société de Publications Radiotechniques.
 B. Paris, 1851. Joined Ecole Polytechnique,
 1871. Commenced work with the State Rail-

ways. In 1876 appointed Principal Stores Engineer of Lyons Railway Company. For his electrical work shown at the Electrical Exhibition of 1881, he obtained the Gold Medal and the Cross of Chevalier of the Legion of Honour. Later became President of several learned Societies. Entered the Bureau des Longitudes, 1897. Invented several pieces of mechanism for musical instruments and photographic apparatus. Inventor of a type of periscope for submarines. Interested himself from the beginning in radiotelegraphy. Founder of the Compagnie Générale Radiotélégraphique, which was later absorbed by the Compagnie Générale de Télégraphie sans Fil.

Gastañon, Lieut.-Col. Don Luis, Spanish Royal Engineers, 1st Chief of Field Wireless Battalion.—B. 1867. One of the pioneers of Wireless Telegraphy in the Spanish Army. Designed and supervised the construction of the Wireless Army Station of Carabanchel EGC (Madrid), the most powerful station of the Spanish Army. Since 1904 in charge of Wireless affairs at the Centro Electrotécnico y de Comunicaciones, Madrid. Distinguished himself in military matters. Took part in the Mindanao, Luzon (Philippine Islands) and Spanish-American campaigns, and was seriously wounded in action. Possessor of twenty-six decorations for military and technical merit, besides one promotion obtained for war merits.

Chaffee, Professor E. L., Assistant Professor of Physics, Harvard University.—B. April 15th, 1885, Somerville, Mass. Educ. High School, Somerville, and Massachusetts Institute of Technology in Boston. Graduated B.S. in Electrical Engineering, 1907. Awarded the degree of M.A. in Physics, Harvard University, 1908, and Ph.D., 1911. Conducted courses in physics and radiotelegraphy at Harvard University. Engaged in research and consultation work in radiotelegraphy. Author of several papers, including "A New Method of Impact Excitation of Electric Oscillations and their Analysis by the Braun Tube Oscillograph," published 1911. During the war engaged in developing some radio apparatus, with which he experimented in France, 1918.

Chamberlain, Eugene Tyler.—Son of General Frank Chamberlain. B. in Albany, N.Y., September 28th, 1856. Educ. Albany Academy and Harvard College. Graduated with honours in Metaphysics, 1878. In business for two years, then took up journalism and acted as legislative and political correspondent to the Associated Press. Came to Washington, 1893. Appointed Commissioner of Navigation by President Cleveland. In 1903, on the creation of the Department of Commerce and Labour, he joined others in urging the importance of wireless telegraphy as a means of promoting safety of life on merchant vessels at sea, and he has since played a prominent part in promoting legislation on this subject. Delegate for the U.S.A. to the Convention on Safety of Life at Sea, at London, 1914. Address: Department of Commerce, Bureau Navigation, Washington, D.C.

Chevallière, Jean Marie Charles Aymé, Baron de la.—B. Poitiers, France, 1858. Educ. in that city. Member of Parliament, Mayor and General Counsellor. After a course at the Military Academy of St. Cyr (1877-79), followed by specialised training at Saumur, remained for fifteen years in the active army as cavalry officer, retiring with the grade of captain in the Reserve, 1892. Member of Légion d'Honneur, Military class. Mobilised from August 2nd, 1914, to July 5th, 1917. Joined the Board

of the Belgian "Société Anonyme de T.S.F." 1901, and subsequently took a prominent part in the initiation of the "Compagnie Française Maritime et Coloniale de T.S.F." now known as "Compagnie Industrielle de Mécanique et d'Electricité," of which he is President and Managing Director. From early 1914 to the end of January, 1918, occupied the post of managing director of the Cie Universelle de Télégraphie et de Téléphonie sans Fil, which on February 12th of the same year was merged in the Cie. Générale de T.S.F., of which he is vice-president. Also Director of "Société Française Radiélectrique" and "Compagnie d'Exploitation Radiélectrique." Address: 23, rue Dumont d'Urville, Paris.

Childs, H. B. T. A.F.R.A.S., A.M.I.E.E.—Chief of Aircraft Dept. Marconi's Wireless Telegraph Co., Ltd. B. Llandilo, S. Wales, 1884. Educ. King's School, Canterbury; London University. Joined the Marconi Company, 1905. Served as Engineer in Russia, Canada, Spain, and Egypt. Joined Royal Flying Corps, autumn, 1915. Served in France, November, 1915, to August, 1917. Appointed to command W/T Experimental Establishment, R.A.F., August, 1917. Promoted Lieut.-Col., December, 1917. Appointed in charge of W/T for the R.A.F. in France, May, 1918, till April, 1919. Mentioned in dispatches, 1916, 1918. Address: Holdenhurst, Oatlands Avenue, Weybridge.

Chree, Charles.—Superintendent of Kew Observatory since 1893. B. 1860, Lintrathen, Forfarshire. Sc.D. of Cambridge, Hon. LL.D. (Aberdeen), F.R.S. Graduated M.A. Aberdeen (1879) with first-class honours in Mathematics and Natural Philosophy. At Cambridge, in 1883, was sixth wrangler, gaining also first-class honours in Mathematical and Natural Sciences Triposes. Fellow of King's College, Cambridge (1885); re-elected Research Fellow (1891). ex-President of Physical Society of London; member of the British Association Committee for Radiotelegraphic Investigation. Holds Watt Medal of Institution of Civil Engineers. Largely concerned with geophysics, especially terrestrial magnetism and atmospheric electricity. For his researches in the former subject received Hughes Medal from the Royal Society. Publications: "Studies in Terrestrial Magnetism," articles in "Encyclopædia Britannica." Address: 75, Church Road, Richmond, Surrey.

Cohen, Louis, Ph.D., Consulting Engineer.—B. 1876. Educ. at Armour Institute of Technology, University of Chicago, and Columbia University. On scientific staff of the Bureau of Standards, 1905-09. Chief of Research Department of the National Electric Signalling Co., 1910-12. Engaged in consulting practice since 1912. Professor of Electrical Engineering, George Washington University. Especially interested in the subject of electrical oscillations. Author of "Formulae and Tables for the Calculation of Alternating Current Problems," and scientific and technical papers dealing with problems in wireless telegraphy and kindred subjects.

Coursey, Philip R., B.Sc. (Eng.), A.M.I.E.E., F.P.S.L., Assistant Editor "The Radio Review."—B. 1892. Educ. University College, London. Awarded Diploma in Electrical Engineering with Distinction. Graduated with first-class Honours in Electrical Engineering at the University of London. Subsequently acted as Assistant to Dr. J. A. Fleming, F.R.S., in the Electrical Engineering Department and Research Laboratories of University College, London. From 1915-18 served as Inspector of Wireless Tele-

graph Apparatus for the Admiralty; afterwards appointed to the Staff of H.M. Signal School, Portsmouth, as Research Physicist. Some time Research Electrical Engineer to the Dubilier Condenser Co. Author of papers on Radiotelegraphy and Telephony, read before a number of Societies, and of "Telephony without Wires." Address: 14, Woodland Villas, Muswell Hill Road, N.10.

Craioveanu, Eugen.—B. 1872. Secondary studies and Grad. in Physics and Chemical Science. Sent by Roumanian Post Office Dept. to study as Telegraph Engineer at Ecole Supérieure des Postes et Télégraphes, Paris, and Post und Telegraphen Hochschule, Berlin. Engineer in all Chemical Branches of Telegraphy and Telephony, Roumanian Post Office. District Director, Chief of Telegraph Postal Service during Balkan War (1913), and also 1916 to 1917. Sub-Director-General of Roumanian Posts, Telegraphs and Telephones, January, 1920. Resigned August 1st, 1920. Engaged in research for modernising technical telegraphy and telephony. Studied wireless thoroughly and now Director-General of Roumanian Marconi Company. Address: Palatul Casei de Credit a Postei, Bucharest.

Crawley, Lieut.-Col. C. G., Royal Marine Artillery (ret.), M.I.E.E., Deputy Inspector of Wireless Telegraphy, General Post Office. Employed at Wireless Telegraphy in the Navy, 1903 to 1913, as Experimental, Instructional, and Fleet Wireless Officer. Deputy Inspector of Fleet Wireless Telegraphy in the Post Office, 1913. Returned to the Naval Wireless service (1914) for the period of the war. During the war served in the Grand Fleet, in command of the R.N.V.R. Wireless School, at the Admiralty, and supervised the erection and working of various Naval stations abroad. Mentioned in Gazette for valuable services, and received letters of appreciation from the Admiralty. Officer of the Order of Aviz. Order of Liakat. R.H.S. testimonial for saving life. Resumed his duties in the Post Office, 1919. Address: General Post Office, London, E.C.

Cresswell, F. G., A.M.I.E.E.—Radio Commander in the Australian Navy. Entered upon professional career, 1897, and received his training and experience with engineering firms in Australia. Entered Government service in the Electrical Engineer's Branch of the Postmaster-General's Department, Melbourne. Commissioned in the Naval Forces of the Commonwealth as Engineer Sub-Lieutenant detailed for electrical duties, 1907. Served in the Royal Australian Navy from the time of its inauguration. Appointed Fleet Wireless Telegraph Officer, 1912, rising to the rank of Radio Commander and Acting Director of the Radio Service, July, 1916. On his return from naval operations in the Pacific during the early stages of the late war, was selected to take over the control, under the Naval Board, of the Wireless Telegraphy Department of the Commonwealth, which had been transferred by Act of Parliament to the control of the Royal Australian Navy. His first work was that of organising the Commonwealth Radio Service on naval lines and under naval discipline. Assisted at the capture of the German high-power wireless stations at Samoa, Nauvu, and Rabaul, being mentioned in despatches for distinguished service. Member of the Institute of Electrical Engineers (Australia). Address: Naval Radio Service, Collins House, Melbourne.

Cross, Professor Charles B.—B. at Troy, New York, March 29th, 1848. Returned with his

father to Newbray Port, Massachusetts, 1862. Graduated at the Putnam Free School in that city, 1865, and engaged temporarily in teaching. Graduated at Massachusetts Institute of Technology, 1870. Appointed instructor in Physics. Became a Junior Professor in Physics, 1875. Placed in charge of the Dept. of Physics, 1877, and later Thayer Professor of Physics and Director of the Rogen Laboratory of Physics. Became interested in the industrial applications of electricity. Lectured upon this subject, 1881. Retired from active teaching, 1918, and made Professor Emeritus. Author of papers embodying the results of researches upon electric and acoustic subjects. Has delivered many public lectures, a number of which were before the Lowell Institute of Boston. Acted as expert for the American Bell Telephone Company throughout the extended litigation concerning the Bell patents, as well as in other telephone cases. Expert for the American Marconi Company in the suits which resulted in the establishment of its fundamental patents. Fellow of the American Academy of Arts and Sciences. Chairman of the Rumford Committee of that institution for twenty-two years. President of the Elizabeth Thompson Science Fund, a member of the American Association for the Advancement of Science, the British Association for the Advancement of Science, and of the American Institute of Electrical Engineers, of which he was one of the original vice-presidents. Past Chairman of one of the three Lectures of the Electrical Congress at the World's Columbian Exhibition at Chicago, 1893.

De Forest, Dr. Lee.—B. Council Bluffs, Iowa, August 26th, 1873. Graduated Ph.D., 1899. Founded the De Forest Wireless Telegraph Co., 1902, the Radio Telephone Co., and the De Forest Radio Telephone Co., 1907. Awarded gold medal for radiotelegraphic work, St. Louis Exhibition, 1904. He distinguished himself in the American-Spanish War, 1898: Member of the Institute of Electrical Engineers of the Franklin Institute, and of the Institute of Radio Engineers.

De Groot, Doctor Engineer Cornelis Johannes, Chief of the Radiotelegraphic Service in the Dutch East Indies.—B. at Den Helder, January 27th, 1883. Educ. as Mechanical Engineer at Technical High School, Delft, and afterwards at Karlsruhe, where he obtained the diploma of Electrical Engineer. During 1915-16 took degree as Doctor in Technical Sciences at Delft University. Spent eighteen months in the service of the G.E.C. of Berlin and thence transferred himself to the Dutch East Indian Government, superintending the erection of various wireless stations in the Indian Archipelago. In 1915-16 visited Europe on furlough and took Doctor's degree on the thesis of "Radiotelegraphy in the Tropics," a notable production which obtained him much *kudos* when subsequently published. A supplementary dissertation upholding the advisability and technical possibility of establishing direct radio communication between Holland and its Colonies won him the honour of having his Doctor's degree conferred *cum laude*, and he was subsequently instructed to carry into practical effect the measures he advocated in that essay. His initial experiments in establishing such communications met with success. Has made many contributions to radio literature, one of the best known being a monograph on "The Nature and Elimination of Strays," originally read before the Institute of Radio Engineers, New York.

Desbarats, George Joseph, C.M.G., B.Sc., Deputy Minister and Comptroller of the Canadian

Naval Service, since June, 1910.—B. Quebec, January 27th, 1861. Educ. Public Schools; Terrebbonne College, Ecole Polytechnique, Montreal (honours and gold medal, 1879); Laval University (B.A.Sc., 1901). Engineer on construction of canals and other public works: assistant to late John Page, Chief Engineer of Canals; Inspector, Railway Construction, B.C., 1892-96; Engineer of Construction, Galop's Canal, 1896-99; employed in hydraulic survey work, St. Lawrence River, three years; rebuilt and enlarged the Government shipyard, Sorel, Quebec, 1901; Acting Deputy Minister of Marine and Fisheries, Ottawa, 1908-09; Deputy Minister, 1909-10; Plenipotentiary for Canada at the Radiotelegraph Conference held at London, England, 1912. Member of the Canadian Society Civil Engineers, 1897; Councillor, 1907; Vice-President, 1909; Councillor, Ecole Polytechnique, 1909; Plenipotentiary for Canada to International Seaman's Conference, Genoa, 1920. Address: Ottawa, Canada.

Destruge, Guillermo, Director General of Telegraphs, Telephones and Wireless, Ecuador, February, 1898, to February, 1906, and from March, 1912, in which capacity he is still serving. Established duplex telegraphic system and telephones in Quito, the capital, 1900. The installation of wireless telegraphy in Ecuador has been instituted under his direction. President of the Radiotelegraphic Commission of the Republic. The personnel of the Telegraphic and Telephonic service of Ecuador presented to him on August 10th, 1920, as an appreciation of his good work, an artistic and valuable gold tablet inscribed. Author of several scientific publications. Address: Apartado No. 59, Quito, Ecuador, South America.

De Valbrenze, R.—One of the first promoters of the use of undamped waves. Presented (1902) an important memorandum to the French Ministry of War on this subject. Attached as Officer of Engineers to the Central Establishment of Military Telegraph *Matériel*. In this capacity studied means for producing undamped waves by means of mercury arcs. Left Army for industry. Published (1906) a work on wireless telegraphy. During the war was a Captain of Engineers attached to the Radiotelegraphic Centre in Paris. Sometime Vice-President of the Société Internationale des Electriciens. Director of several Technical Societies. Chevalier of the Legion of Honour.

De Vasconcellos e Sa, Dr. Alexandre, State Secretary of the Portuguese Colonies.—B. November 28th, 1872. Graduated as a Doctor of Medicine in the Medical School at Lisbon. Joined the Portuguese Navy, 1894, where he gained a reputation as a physician and surgeon. After the proclamation of the Portuguese Republic in 1910 interested himself in politics, and as a member of Parliament specialised in Colonial subjects. Served in the Barú Campaign, 1912. Chief Health Officer to the expedition sent to Cuamato when the Germans invaded Portuguese territory, 1913-15. His services won him the highest military distinction granted by the Portuguese Navy. On returning from the expedition to Angola was appointed Commissioner of the Portuguese Government to the Mozambique Company. Secretary of State to the Colonies, May 14th, 1918. In this capacity devoted considerable attention to the development of radiotelegraphy in the Portuguese colonies.

Dubilier, William.—B. July 25th, 1888, in the U.S.A. Consulting radio engineer and inventor. Devoted much attention to wireless

telegraph, telephone, and high-frequency experiments. Since 1904 Consulting radio engineer. Principal of the Dubilier Electrical Syndicate, Ltd., London, England, and of the Dubilier Condenser Co., Inc., New York. Inventor of the Dubilier Mica Condenser. Obtained over 150 patents and applications for wireless apparatus. Address: Aero Club, New York.

Eccles, W. H., B.Sc., A.R.C.S., M.I.E.E., Professor of Applied Physics and Electrical Engineering at the City and Guilds of London Technical College, Finsbury, E.C.; Vice-President of the Physical Society; Member of Council and Chairman of the Wireless Section of the Institution of Electrical Engineers; Examiner in mathematics at the London University, and honorary secretary of the British Association Committee for Radiotelegraphic Investigation.—B. Furness, Lancs, 1875. Entered the Royal College of Science, South Kensington, in 1894. Three years later was appointed demonstrator in the Physics Laboratory at the College, and in 1898 graduated at the London University with first-class honours in Physics. In 1899 he entered Mr. Marconi's laboratory at Chelmsford and spent a great part of his time in the investigation of electrical oscillations of air wires and in "jiggers." Devised a laboratory method for testing and classifying coherers, and results of a later study of coherers were presented as one of his D.Sc. theses. In 1901 was appointed Head of the department of mathematics and physics at the South-Western Polytechnic, Chelsea, and afterwards University Reader in Graphics at University College, London. Address: 2, Ryder Street, St. James's, S.W.1.

Eichhorn, Gustav, Ph.D.—B. Düsseldorf (Germany), December 1st, 1867. Studied Physics. After the sudden death of his father became managing director of the paternal paper-mills for ten years. Returned to the profession of his choice and continued his interrupted studies. After three years at Berlin, Munich, and Zürich, took the degree (Phil. Dr.) at the last-named University. Entered the wireless telegraph laboratory of Prof. Braun-Siemens and Halske, in Berlin. Appointed manager of their experimental stations on the Baltic, where for about eighteen months he conducted a number of investigations. Collaborator of various technical journals. Inventor of the buzzer-device which is used in connection with wave-meters and other instruments to use same as oscillators. Returned to Zürich, 1905, and launched the *Jahrbuch de drahtlosen Telegraphie und Telefonie*, 1907. Engaged in practical and theoretical work in wireless telegraphy and telephony. Address: Hauptpostfach 6123, Zürich, Switzerland.

Eisenstein, S. M.—B. Kief, Russia. Educ. Kief University. Studied at the University of Berlin and the Charlottenburg Polytechnic. First turned his attention to wireless telegraphy, 1900. Obtained his preliminary wireless patent and established a private experimental laboratory, 1904. General Soukominoff, then commanding the troops of the Kief Division, heard of the young wireless enthusiast and encouraged him to carry out experiments on a large scale, eventually prevailing on the Russian War Office to provide the young scientist with sites for the erection of stations. The action, taken in consequence by the War Office, resulted in the realisation of the necessity for forming a wireless company; the project speedily materialised and Mr. Eisenstein changed his headquarters from Kief to Petrograd. The new departure

speedily justified itself, and in 1911 the original company coalesced with the Marconi Company, and the reconstructed Russian Organisation, with Mr. Eisenstein as Director and Principal Technical Adviser, assumed responsibility for the development of Russian wireless.

Erskine-Murray, James, D.Sc., F.R.S.E., M.I.E.E., F.I.Radio E.—B. Edinburgh, October 24th, 1868. After six years' study and research under the late Lord Kelvin at Glasgow University entered Trinity College, Cambridge, as a research student. Assistant Professor of Physics and Electrical Engineering in the Heriot-Watt College, Edinburgh, 1896-98. Appointed experimental assistant to Mr. Marconi, 1898. Lecturer and Demonstrator in Physics and Electrical Engineering at University College, Nottingham, 1900. Lecturer in Electrical Engineering at the George Coates Technical College, Paisley, 1905. Consulting work in radiotelegraphy, 1905. Lecturer on Radiotelegraphy at the Northampton Institute, London, 1907-11. Contributed papers to numerous learned societies. Author of several works on wireless telegraphy. Partner in the firm of Clark, Forde, Taylor, and Erskine-Murray, consulting engineers, 1913-18. Joined the Royal Naval Volunteer Reserve, 1917, with rank of Lieut.-Commander. Now serving with the Royal Air Force in charge of the design of wireless instruments and of experimental work. Address: 16, Elmfield Road, Bromley, Kent; Telephone, Bromley 858; Club, Caledonian.

Ewen, Harry Alexander.—B. Aberdeen, December 17th, 1877. Educ. Aberdeen Grammar School; Liverpool Institute. Received Engineering training at Heriot-Watt College. Medallist in Elec. Eng. and Elec. Eng. Hons., 1901-02. Joined Engineering Staff of Marconi's W/T Co., 1902. Appointed Wireless Telegraph Expert to the Brazilian Navy, 1910; later rejoined Marconi's W/T Co., and appointed Chief of Drawing and Design Dept. Address: "Braeside," Priest Lane, Shenfield, Essex.

Farrand, C. L.—B. Newark, N.J., October 22nd, 1891. Educ. Central High School, Philadelphia, Pa. Wireless operator and instructor, 1909-13. Inspector of construction work, 1913, testing and designing of coastal stations. Assistant to Mr. H. Shoemaker, the research engineer of the Marconi Laboratory, Aldene, N.J. Engineer-designer in Aldene, N.J., 1917, especially devoting his attention to radiotelegraphic research and design. His research work has been particularly associated with the De Forest Valve litigation, the development of valves, and the elimination of static. His activities have been mainly exercised in connection with the design of commercial and naval quenched spark apparatus, regenerative valve receivers and regenerative valve transmitters, both telephonic and telegraphic.

Ferrié, General Gustave, Technical Director of French Military Radiotelegraphy. Officer of the Legion of Honour, D.Sc. of the University of Oxford, Companion of St. Michael and St. George, Commander of the Crown of Italy, Officer of the White Eagle of Serbia, Holder of the Distinguished Service Medal of the United States, Commander of the Double Dragon of China, Officer of La Couronne.—B. at St. Michel de Maurienne (Savoy), November 19th, 1868. His connection with wireless telegraphy started February, 1899, when he was present during experiments of Senatore Marconi between Wimeux and Dover. Initiated French Military Radiotelegraphic Service in 1900. Was member of French Delegation to the International

Electrical Congress of St. Louis in 1904. Member of the French Delegation to the International Radiotelegraphic Conference of London (1912). Appointed General Secretary of the International Time Conference, Paris (1913). He has, in the course of a brilliant career, written a large number of monographs and periodic contributions dealing with radiotelegraphy and kindred subjects, both from a technical and organisation point of view. Address: Ministère de la Guerre, Paris.

Fessenden, Reginald Aubrey.—B. Milton, Canada, October 6th, 1866. Educ. New York and Port Hope, Ontario. Inspecting engineer to the Edison Company, N.Y., 1866. Took up teaching work and conducted classes in physics and electrical engineering at Western University, 1892. Professor of Electrical Engineering at Western University, Philadelphia, 1893. Special Agent to the U.S. Weather Bureau, 1900. Has devoted much attention to the development of a system of wireless telegraphy known by his name, and has also carried out important experiments in wireless telephony. Contributor of articles on wireless telegraphy and telephony to many technical journals.

Field, Rear-Admiral F. L., C.B., C.M.G., 3rd Sea Lord and Controller of the Navy; Member of Committee (appointed November, 1919) to advise British Government on Imperial W/T Communications.—B. April 19th, 1871. Entered Royal Navy, July, 1884; promoted Lieut., 1893; qualified as Torpedo Lieut., 1896. Landed in expedition for Relief of Legations at Peking from H.M.S. "Barfleur," 1900. Mentioned in despatches; wounded at taking of Tientsin Native City. Promoted Commander, 1902; Captain, 1907; Commanded H.M.S. "Duncan," 1910; Superintendent of Signal Schools, 1912; Capt. H.M.S. "Vernon" (Torpedo School), 1914; Capt. H.M.S. "King George V" at Battle of Jutland; mentioned in despatches, awarded C.B. (Military division). Chief of Staff to Admiral Second-in-Command Grand Fleet, 1916. Awarded C.M.G. for this service. Director of Torpedoes and Mining at Admiralty, 1918. Promoted Rear-Admiral, February 11th, 1919. Appointed 3rd Sea Lord and Controller, April 15th, 1920. Address: Admiralty, Whitehall, London, S.W.1.

Fisk, Ernest Thomas, M.I.Radio E.—B. Sunbury-on-Thames, August 8th, 1886. Educ. Primary and High Schools. Studied physics, mathematics, and commercial subjects. After two years with Messrs. Frederick Walton and Co., he entered the British Telegraph Service. Joined the Marconi Company in England (1905). Temporarily engaged in engineering branch of the American Marconi Company, erecting stations on ship and shore. Undertook a special mission to the Arctic icefields, 1909, and demonstrated the possibilities of wireless communication with Newfoundland Sealing Fleet. Visited the Antipodes, 1910, in R.M.S. "Otranto," and demonstrated the use of the Marconi apparatus for the Orient Mail Line of steamers. Again visited Australia, 1911. General Manager with a seat on the board of directors of Amalgamated Wireless (Australasia), Limited, 1913. Revisited England, 1916. Shortly after return to Australia, accepted position as Managing Director of the Company. Tested possibility of direct wireless communication between England and Australia. Gave the first public demonstration of wireless telephony in Australia before the Royal Society of New South Wales. Reorganised manufacturing work. Managing Director of the Austral Electric Company. Founder

and initiator of "Sea, Land, and Air," the first journal in the Southern Hemisphere to deal with aviation and wireless. Established the Australasian branch of the Wireless Press. Member of the Electrical Association of Australia, President of the Wireless Institute of Australia (New South Wales Section), Member of the Sydney Chamber of Commerce and the Chamber of Manufacturers, Member of the Executive Committee, Australasian Industries Protection League, Member Provisional Committee appointed to consider the formation of the Chamber of Science and extending application of science to industry. Chairman Section of Industry, Royal Society of N.S.W., 1920-21.

Fleming, John Ambrose, D.Sc., M.A., F.R.S., University Professor of Electrical Engineering, University of London (1912).—B. Lancaster, November 29th, 1849. Educ. University College School, London; University College; R. School of Mines. Sometime Fellow of St. John's College, Cambridge; Fellow and Hughes Gold Medallist, Royal Society. Lecturer in mechanics and applied science, Cambridge University (1880). First Professor of Mathematics and Physics (1881), University College, Nottingham. First occupant of Pender Chair of Electrical Engineering, University College, London (1885); Vice-President of Wireless Society of London. Sometime Vice-President of Institution of Electrical Engineers and Physical Society. Honorary Member of the Royal Engineers' Institute, Chatham. Scientific Adviser to the Edison and Swan United Electric Light Company, 1882-93. Scientific Adviser to the London Electric Supply Corporation, and many other corporations, firms and companies in electrical matters. Publications: Numerous contributions to scientific literature and research. Author of well-known text-books, particularly on wireless telegraphy. Twice awarded Institution Premium of Institution of Electrical Engineers; also silver medal of Royal Society of Arts, and Bernay's Premium of the Society of Engineers. Widely known as inventor of the Thermionic Valve or Fleming Valve, the judicial decisions on which have declared it to be a pioneer invention of unusual utility, and one that has enormously aided the development of wireless telegraphy. Address: The Pender Electrical Laboratory, University College, Gower Street, London, W.C.1.

Forberg, Olaf E., Director of Telegraphs, Iceland.—B. November 22nd, 1871, in the Province of Finnmark, Norway. Early attached to the Norwegian Telegraphic Service, first as a Telegraphic Clerk, later as the head of a station; Manager of the Controlling Station, Veblungnes, in the Romsdal, 1900. Erected several new telegraphic plants in Norway, 1893-1904. Went to Iceland on an inspection, 1905, and in 1906 he constructed the telegraphic line from Reykjavik to Seydisfjord. Superintended the erection of stations and organisation of the telegraphic system in Iceland. Director of Telegraphs in Iceland, 1907, and controls both the wired and wireless nexus of the island. Member of the Engineers' Association of Iceland. Knight of Dannebrog, 1907. Address: Director of Telegraphs, Reykjavik, Iceland.

Fortescue, Cecil E., Professor of Physics, Royal Naval College, Greenwich, since January, 1911.—B. January 15th, 1881. Educ. Oundle School and Christ's College, Cambridge. First-class Honours, Mechanical Sciences Tripos, 1903. Engineering training with Messrs. Siemens Dynamo Co., Stafford, 1903-06. Civilian Instructor in Applied Mechanics and Electro-Technics at H.M. Gunnery and Torpedo Schools,

Portsmouth, October, 1906. During the war attached to Wireless Telegraphy Department, H.M.S. "Vernon," and at H.M. Signal School, Portsmouth. Member of Institution of Electrical Engineers, serving on Committee of Wireless Section of that Institution. Fellow of the Institute of Physics. Member of the Physical Society of London, serving on the Council. Member of Sub-Committee "D" on Thermionic Valves of Radio Research Board, of the Department of Scientific and Industrial Research. Address: Royal Naval College, Greenwich, S.E.10.

Franklin, Charles Samuel.—B. 1879. Received engineering and scientific training at Finsbury Technical College, under Professor Sylvanus Thompson. After some time spent in electrical work, first at Manchester and afterwards with the Norwich Electricity Company, joined Marconi's Wireless Telegraph Company (then known as the "Wireless Telegraph and Signal Company"), 1899, and still remains in their service. He has during recent years been engaged in conducting experimental and research work on behalf of Senatore Marconi, and has a number of important patents to his credit.

Frey, Emile, Director of the International Bureau of the Telegraph Union since 1897; Director of the International Bureau of the Radiotelegraphic Union since 1910. Swiss politician.—B. 1838, Alesheim. Visited United States, and took part in American Civil War, serving with the Northern (or Federal) Army. Returned to Switzerland, 1865. Member of the National Council, 1872, of which he was Chairman from 1875 to 1876. Swiss Minister Plenipotentiary at Washington, 1882-88. Member of the Federal Council, 1890, Vice-President, 1892. President of Swiss Confederation, 1893. Resigned from the Federal Council, 1897. Address: Bureau International de l'Union Télégraphique, Berne, Switzerland.

Frouin, M.—Director of French Telegraphs, one of his country's representatives at the International Radiotelegraphic Conference, London, 1912.

Gentil, Captain Antonio Alves Soares Branco, Member of Technical Committee of Portuguese Naval Wireless Telegraphy.—B. March 7th, 1874. Educ. at the Polytechnic and Naval Schools. Between 1893 and 1909 filled various Naval posts in Angola and Mozambique. Qualified as Torpedo Operating Officer at the Naval College of Val de Zebro in 1909, appointed Instructor of Wireless Telegraphy at the Naval College in 1910. Qualified as Submarine Commander in 1915. In 1916 became member of the Technical Committee of Naval Wireless Telegraphy appointed to investigate and make recommendations concerning wireless in all Portuguese Colonies. Address: Portuguese Admiralty, Lisbon.

Girardeau, Emile, Managing Director, Société Française Radio-Electrique and Cie Gle de Télégraphie sans Fil. Director of the Cie d'Exploitation Radio-Electrique.—B. 1882. Educ. Ecole Polytechnique. Joined the Army and served as an officer in the Engineers. Author of various works on a number of subjects relating to wireless telegraphy. Played an important part in the creation and organisation of the Société Française Radio-Electrique, of which he is the founder. He is a Member of Légion d'Honneur.

Glazebrook, Sir Richard Tedley, Kt., C.B., M.A., D.Sc., F.R.S.—B. Liverpool, Sept. 18th, 1851. Educ. Trinity College, Cambridge. Fifth Wrangler. Studied Physics as Graduate

at the Cavendish Laboratory, Cambridge, under Clerk Maxwell and Lord Rayleigh. Fellow of Trinity College, Cambridge (1877). Principal of University College, Liverpool (1898-99). First Director of the National Physical Laboratory (1899-1919). Chairman of the Aeronautical Research Committee. Zaharoff Professor of Aviation and Director of the School of Aeronautics, Imperial College. Past President of the Institute of Electrical Engineers. Medal of the Royal Society of Arts (1918). Member of Technical Committee inquiring into Imperial Wireless scheme. Publications: Numerous works on Physical Optics, Laws and Properties of Matter, text-books on Heat, Light, Mechanics and Electricity, as well as numerous papers in Scientific and Technical Journals. Address: Coton End, 63, Grange Road, Cambridge.

Gold, Lieut.-Col. E., D.S.O., F.R.S., Assistant Director of Meteorological Office.—B. Berkswell, Warwickshire, July, 1881. Educ. King Henry VIII's Grammar School, Coleshill; Sir Josiah Mason's College, Birmingham; St. John's College, Cambridge. (Third Wrangler, 1903.) Part II Natural Science Tripos, 1904. Lecturer in Mathematics, City of London College, Moorfields, 1904; Fellow St. John's College, Cambridge, 1906; Superintendent, Instruments Division, Meteorological Office, 1906; First Schuster Reader in Dynamical Meteorology (1907); Superintendent of Statistics, Meteorological Office (1910). Gazetted Capt., June, 1915, and attached G.H.Q. as Meteorologist to R.F.C. D.S.O. for services in Battle of Loos, and promoted Major. Appointed to command of new Meteorological Section, R.E. Mentioned in dispatches five times; promoted Lieut.-Col., March, 1918. Represented British meteorology in Aeronautical Convention at Peace Conference, 1919. Research: Identification of negative "ions" in flames with "electrons" (1905); relation between barometric pressure and wind velocity (1906); atmospheric radiation (1907). Publications: Report on existing state of knowledge of upper atmosphere (read British Association, 1919); "International Kite and Balloon Ascents" (1911), which gained German Meteorological Society's prize open to all the world. Address: 8, Hurst Close, Bigwood Road, Hampstead Garden Suburb, London, N.W.

Goldschmidt, Professor Dr. Rudolf.—B. March 19th, 1876, at Neu-Bukow, Mecklenburg, Germany. Educ. Wismar Municipal School. Studied engineering at Charlottenburg and Darmstadt Technical High School. Engineer in the laboratory of the A.E.G. in Berlin, 1900. Chief laboratory engineer and designer in Prague, 1901-02. Chief engineer and designer at Cromptons and Co., Ltd., Chelmsford, 1902-05; similar position with Brit. Westinghouse El. and Man. Co., Manchester, 1905-07. Lecturer at Darmstadt Technical College, 1907. Here he practised as a consulting engineer, and also pursued the development of several inventions, chiefly occupying himself with the invention and design of high-frequency alternators for wireless telegraphy. Established (1911) two large wireless stations at Elville, Province of Hanover, and Tuckerton, New Jersey, U.S.A., for wireless communication between Germany and America. Address: Berlin-Westend, 45, Lindenallee.

Goldsmith, Prof. Alfred N., B.Sc., Ph.D.—B. New York City. Graduated from the College of the City of New York and Columbia University. Author of "Elements of Physics," "The Transmission of Canal Rays through Thin Partitions," "Radio Engineering at the College

of the City of New York," "The Engineering Measurements of Radiotelegraphy," "Radiotelephony," and other works. Research worker in radio communication, and particularly in radiotelephony. Director of Radio Engineering Laboratory at the College of the City of New York. Editor of the "Proceedings of the Institute of Radio Engineers," Chairman of the Standardisation Committee of the Institute of Radio Engineers (1915), Secretary of the Institute (1918-20), and Member of Board of Direction of the Institute. Fellow of the Institute of Radio Engineers, Fellow of the American Institute of Electrical Engineers, Member of the American Physical Society. During 1917-18 Technical Director of the U.S. Signal Corps School of Radio and Multiplex Telegraphy, New York, besides being associated with the U.S. Naval Radio Compass School. Director of the Research Department of the Radio Corporation of America, and for the Pan-American Wireless Telegraph and Telephone Co. Address: The College of the City of New York.

Gottwaldt, Commander B. L., late Inspector of W/T, Norwegian Navy Department. Technical Manager, Norwegian Wireless Company (Norsk Marconikompani).—B. Christiania, 1880, entered Naval Academy, Norwegian Navy, 1898. Graduated sub-lieutenant, 1901. Attended the Military Academy of the Royal Navy, 1901-04, afterwards the Technical College, Charlottenburg, Berlin. At the latter studied electrical engineering, telegraphy, telephony, and wireless telegraphy. Visited (1906) England on behalf of the Norwegian Admiralty to attend to some special work with Messrs. Armstrong, Whitworth Co., Newcastle-on-Tyne. Returned to Norway and placed in charge of W/T in the Royal Norwegian Navy, where he was responsible for the erection of naval, land and ship stations. Appointed Commander, 1912. Entrusted with the control and test of wireless apparatus ordered in England and Germany by the Norwegian Government. One of the Norwegian delegates at the International Radio Conference in London, 1912. He has written a number of articles, and three books on wireless. Address: 15, Baldersgate, Kristiania.

Gray, Andrew, A.G.T.C., Assoc. M.Inst.C.E., M.I.E.E., Chief Engineer of the Marconi Parent Company (since 1910).—B. Glasgow, 1873. Educ. Glasgow University; Royal Technical College. Diploma of latter in electrical engineering. Served as assistant to late Professor Andrew Jamieson, of Royal Technical College. Joined the West India and Panama Telegraph Company, Ltd. (1893), serving respectively as assistant electrician, chief electrician, and telegraph engineer. Entered Marconi Company, 1899. Introduced Marconi system to Hawaiian Islands. Organised telegraph working and trained native operators of Inter-island Telegraph Company of Honolulu. Appointed Chief of Staff to the Marconi Companies, and in that capacity organised the working of the ship and shore wireless service, designed the original 1½ kw. Ship Set, and supervised the ship and shore operating until 1906, when the engineering and traffic work were separated. Address: 78, Cressfield Road, Acton, W.3.

Grenfell, Wing Commander George Pascoe, D.S.O. (1917).—B. 1883. Educ. privately. Successively on staffs of Eastern Telegraph Co., Ltd.; Amalgamated Radio Telegraph Co., Ltd. (De Forest & Poulsen Systems); British Radio Telegraph Co., Ltd. Went overseas 1915 in charge of Wireless in R.F.C., Middle East. Served in Egypt, Senussi campaign, and Salonika.

Transferred to H.Q. Staff—R.F.C., B.E.F., France, end of 1916. In charge of W/T (Communications and Artillery Co-operation). Mentioned in dispatches, 1917. Returned to England and joined Staff of Director of Air Organisation, Air Ministry, as S.O. 1, June, 1918. Appointed member of W/T Board, June, 1918. Took command of W/T Experimental Establishment, Begg n Hall, December, 1918. Address: R.A.F., Begg n Hall, Kent.

Hammond, John Hays, Jr.—B. San Francisco, April 13th, 1888. Educ. Preparatory Schools in England and the U.S. Graduated from the Yale-Sheffield Scientific School, 1910. Working ever since on the development of the system of radio control of torpedoes and other moving bodies. Originator of the system of aerocoastal patrol, comprising aeroplanes equipped with wireless, which received the endorsement of President Wilson, the Secretary of Navy, and the Secretary of War. Author of a four-volume treatise on the Art of Teledynamics. Treasurer of the Institute of Radio Engineers, and Manager and Chairman of the Committee on Admissions. Associate Member of the American Society of Mechanical Engineers. Delegate to the London International Radio Telegraphic Conference, 1912. Member of the American Institute of Electrical Engineers. Received honorary degree of Doctor of Science at George Washington University, June, 1910. Invented system of aerial radio surveying and mapping, which has been adopted by the Bartlett Expedition for Polar Basin surveying. Inventor of thermite incendiary shell, testing by Bureau of Ordnance, War Department. Inventor of the Radio-dynamic Torpedo, testing by U.S. War Department. Address: Hammond Radio Research Laboratory, Gloucester, Mass.

Harrison, Lieut.-Col. Norman, C.M.G., D.S.O., M.I.E.E.—B. 1873. Educ. in Natal. Served in South African War, and European War, 1914-19, as Director of Army Signals in German South-West Africa, and as Assistant Director of Army Signals, and Commanding South African Signal Units (attached to Corps of Royal Engineers) in France, 1916-19. Engineer-in-Chief of Posts and Telegraphs, Union of South Africa since 1910. Addresses: (1) G.P.O., Pretoria; (2) Pretoria Club, Pretoria; (3) Civil Service Club, Capetown.

Hayashi, Professor Fusakichi, Ph.D., Professor at the Kyushu Imperial University, June, 1919.—B. Tokushima prefecture, 1879. Graduated from the Science College of the Tokyo Imperial University, July, 1903. Studied at the University Hall, and at Göttingen University, 1900-12, and Jena University, 1912-13. After engagement from the Governors of Kiangsu and Shansi provinces as instructor at normal schools for several years, served in the Navy Dept. and engaged in studies on radiotelegraphy, January, 1914. Promoted Naval Engineer, June, 1914.

Hogan, John V. L.—B. Philadelphia, Pa., U.S.A. Educ. Scientific School of Yale University, specialising in physics and mathematics. Assisted Dr. Lee De Forest in his work on experimental Radiotelephony, and in the development of the grid audion, 1906 and 1907. Joined the staff of the National Electric Signalling Company at Brant Rock, Mass., 1909. Appointed Chief Research Engineer of that Company, 1914. In 1917 the Company changed its name to the "International Radio Telegraph Co.," and in 1918 he was appointed manager. Author of "The Heterodyne Receiving System," "Wireless Telegraphy in Railroad Service," "Transatlantic Radiotelegraphy," and numerous other

articles and papers published in the Proceedings of the Institute of Radio Engineers, the "Electrician" (London), the "Electrical World," the "Jahrbuch der D.T.U.T.," etc. Fellow of the Institute of Radio Engineers, and Vice-President since 1916. Member of the American Association for the Advancement of Science, of the American Institute of Electrical Engineers, and honorary member of the Radio Club of America. Chairman of the Standardisation Committee of the Institute of Radio Engineers since 1916. He is the holder of a number of patents embodying inventions relating to radiotelegraphy, and has been identified with important patent litigation as principal technical witness. Address: C o International Radio Telegraph Co., 326, Broadway, New York, U.S.A.

Holmstrom, J. Gunnar, Director of Radio-telegraphic Instruction, Stockholm, Kt. of "Vasa" Order.—B. Stockholm, April 23rd, 1874. Passed through Poly. Acad., Stockholm, 1896. Assistant Royal Swedish Telegraph Dept., 1892. Teacher at Swedish Artillery and Engineers' College, 1901, and College for Naval Officers, 1908. Head of the Telegraph Department's School, 1902. Publications: "Lärobok in Telegraf," 1911, and "Handbok i Radiotelegraf," Stockholm, 1908. Address: Malmkillnadsgatan 19 B, Stockholm.

Hooper, Commander Stanford C., United States Navy.—In charge of Radio material, construction, supply and development in the Bureau of Engineering attached to the U.S. Navy. B. August 16th, 1884, Colton, Cal. Educ. at San Bernardino, California. Started his career as telegraph operator in the Southern Pacific Company, afterwards transferring to the Postal Telegraph Company. Entered the Naval Academy, Annapolis, Md., September 6th, 1901. Graduated January 31st, 1905. Served as midshipman on the cruiser "Chicago," destroyer "Perry," and monitor "Wyoming," and later on various ships as ensign, 1907, lieutenant, 1910, lieutenant-commander, 1915, commander, 1918. Instructor of electrical engineering, physics, and chemistry at the U.S. Naval Academy, 1910-11. Fleet Radio Officer of the United States Atlantic Fleet, 1912-13, taking part in the capture of Vera Cruz, Mexico. Early in the war acted as observer in Europe. In charge of the Radio Division Bureau of Steam Engineering, Navy Department, 1915-17. Commanded the destroyer "Fairfax" in the Atlantic during 1917-18, then returned to take up duties in the Navy Department, 1918. Address: Navy Dept., Washington, U.S.A.

Hope-Jones, Frank, Chairman, Wireless Society of London.—B. 1867. From 1890 to 1895 associated with his elder brother, Robert Hope-Jones, in some of his earliest applications of electricity to organ-building. Has established the business of electric time service on a scientific basis. Member of the Institution of Electrical Engineers and the British Horological Institution. Author of numerous contributions to technical journals and to the Proceedings of Scientific Societies. Address: 32 and 31, Clerkenwell Road, E.C.1.

Howe, Prof. George William Osborn, D.Sc., M.I.E.E.—B. 1875, Charlton, Kent. Educ. the Roan School, Greenwich, Woolwich Polytechnic, Durham University. Nine years with Siemens Bros., at Woolwich, and Siemens and Halske, at Charlottenburg. Two years lecturer at Hull Technical School. Lecturer and later Assistant Professor of Electrical Engineering at the City and Guilds Engineering College, which forms the engineering section of the Imperial College of Science and Technology at

South Kensington. D.Sc. of Durham, hon. D.Sc. of Adelaide University. Whitworth Scholar. Has read several papers on Radiotelegraphy before the Royal Society, the British Association, the Physical Society, etc. Awarded the silver medal by the Royal Society of Arts (1912) for his paper on "Some Recent Developments in Wireless Telegraphy." Fellow of the Physical Society. Member of the Radiotelegraphic Research Committee of the British Association and of the Wireless Sectional Committee of the Institution of Electrical Engineers. Accepted an important appointment at National Physical Laboratory, 1921. Editor, "Radio Review." Address: City and Guilds Engineering College, South Kensington, London, S.W.

Hoyle, Lieut. Bertram, M.Sc., A.M.I.E.E., Assistant Lecturer, Victoria University and College of Technology, Manchester.—B. Oldham. Educ. College of Technology, Manchester (of which he is now an Associate), and at the Victoria University, Manchester. In 1907 he obtained the Certificate and Diploma in Technology and M.Sc. (Tech.) of Victoria University. Served with Messrs. Henry Simon, Ltd., Manchester, and with Messrs. S. Z. de Ferranti, Ltd., Hollinwood. Assistant Lecturer and Demonstrator in Electrical Engineering at the College of Technology, Manchester, 1911. Had charge of the design and erection of the wireless station with which the School of Technology is equipped. Enlisted early in 1915 as a motor cycle despatch rider, and served on the Western Front. In September, 1915, gazetted Lieut. R.N.V.R. Author of "Standard Tables and Equations," and a number of technical essays and monographs. Address: 18, King's Drive, Heaton Moor, near Stockport.

Illingworth, Albert Holden, P.C., M.P., British Postmaster-General since Dec., 1916. (L.) Heywood Div. S.E. Lancs, 1915 to 1918. Heywood and Radcliffe since 1918.—B. 1865. As Postmaster-General is in supreme direction of Civil Wireless Telegraphy as far as United Kingdom is concerned. Address: Denton Park, Ben Rhydding, Yorks; 60, Eaton Place, S.W.1.

Isaacs, Godfrey C.—Educ. England, France, and Germany. Began life in his father's business, and a few years later was manager. Managing Director of Marconi's Wireless Telegraph Co., Ltd., and the Marconi International Marine Communication Co., Ltd., 1910. Addresses: Lyne Grove, Virginia Water, Surrey, and 31, Wellington Court, Knightsbridge, S.W.1.

Jackson, Admiral of the Fleet Sir Henry Bradwardine, G.C.B., K.C.V.O., D.Sc., LL.D., F.R.S., M.I.E.E.—B. Barnsley, January 21st, 1855. Entered Royal Navy December, 1868. Capt. 1896; Rear Admiral 1906; Controller of Navy 1905-08; Commanded 6th Cruiser Squadron 1908-10; Chief of Naval War Staff 1912-14; First Sea Lord May, 1915-December, 1916; President R.N. College, Greenwich, 1917-19. Hon. Vice-President of Inst. of Naval Architects. Vice-President of Wireless Society of London. Chairman of Radio Research Board 1920. Hon. D.Sc. Leeds and LL.D. Cantab. Whilst Commander of H.M.S. "Edinburgh," in 1893, conceived the idea of using Hertzian Waves for Naval signalling purposes, especially in connection with Torpedo Boat Work, experimented intermittently in this direction by exciting a circuit which included a filings coherer tapped by the hammer of a high-resistance trembling bell. Continued to take much interest in the development of W.T., and assisted in its organisation in the Navy. Address: 37, Catherine Street, London, S.W.1.

Janet, Paul.—Professor of Physics, University of Paris, Director of the Central Laboratory and of the High School of Electricity. B. January 10th, 1863, in Paris. Studied at the Lycée Louis-le-Grand and the High School. Member of the French Society of Physics, the International Society of Electricians, and the Society of Civil Engineers of France. Professor of Physics at the University of Grenoble, 1886-94. Author of several important works. First to make a successful experiment in electric resonance by means of high-frequency currents, 1892; this is the phenomenon used to-day in wavemeters.

Jenner, Axel.—B. 1885. Student 1904. Assistant at the Swedish Telegraph Service 1905. Passed the course for superintendents of the wireless stations 1916. Since 1916 superintendent of the wireless station at Boden, Sweden. Address: Boden, Sweden.

Jotikassatra Hang, Chief of the Wireless Department of the Naval General Staff, Siam.—B. at Bangkok, September 27th, 1876. Educ. at Bangkok and at Penang. In 1890 he was sent to Europe to be educated as an engineer. He studied seven years at Erfurt, and entered in the Technische Hochschule at Hanover in 1897. On passing the final examination of that school in 1902, he returned to Siam and joined the Siamese Navy as an Engineer-Lieutenant. 1907-12, an instructor in the Naval Cadet School. Awarded the title of Luang Nava Vichitr, 1911. Joined the Naval General Staff as the Chief of the Wireless Department, 1912. Promoted Commander 1918. Awarded the title of Phra Vidyu Duralikhrit 1920. Address: Bangkok.

Kadōka, Hayao.—B. Tokyo, March, 1883. Graduated from the Tokyo Imperial University, July, 1906. Studied at the Earthquake Prevention Investigation Commission in the Dept. of Education, November, 1908. Lecturer at the Science College of the Tokyo Imperial University, March, 1909. Served in the Army, for researches on radiotelegraphy. Proceeded to Europe and America for inspection of the war-time condition of radiotelegraphy, 1917-1918. Since 1911 designed several radio stations.

Kajima, Akira.—B. Tokyo, 1883. Graduated from the Greek Catholic Mission School, Tokyo, 1904, and became publisher of a religious magazine. Interpreter at the French Embassy from 1905 to 1906. Received a medal in recognition of distinguished services. Joined the editorial staff of the *Chuo Shimbun* in 1906 and that of the *Kokumin Shimbun* in 1908. Established the Japanese Wireless Press in 1911 and the Nippon Radio Apparatus Manufacturing Company, 1915. Started a monthly magazine named *Musen no Nippon* or Wireless Press, in 1918. Managing Director, Nippon Radio Telegraph and Telephone Co., Ltd. Office address: 1280 Shimo Shibuya, suburb of Tokyo. Private residence: 46, Kobinata-Daimachi 1-chome, Koishikawa, Tokyo.

Kennedy, Sir A. B. W., F.R.S.—B. London, March 17th, 1847. He has had great mechanical engineering experience. Some time President of the Institution of Civil Engineers, and the Institution of Mechanical Engineers. Professor of Engineering at University College, London, 1874-89, and founded there the first "Engineering Laboratory." Designed electric lighting and power stations for many companies and corporations, and has also been engaged in railway and constructive work. Knighted 1905 for his services to the Admiralty. Member of the

Technical Committee appointed by the Postmaster-General to consider the Imperial Wireless Scheme. Civilian Member of the Ordnance Committee. During the War was Member of the Munitions Inventions Panel, and Vice-chairman of the Anti-Aircraft Equipment Committee (Ministry of Munitions). Consulting Electrical Engineer to the L.N.W.R., L.S.W.R., and the London County Council. Chairman of the Electn. of Railways Advisory Committee (Ministry of Transport). Address: A7, The Albany, Piccadilly.

Kennelly, A. E.—B. Calaba, Bombay, December 17th, 1861. Educ. in England, Scotland, Belgium, France and Italy. Past-President of the American Institute of Electrical Engineers, Past-President of the American Association of Illuminating Engineers; President, in 1916, of the Institute of Radio Engineers; Vice-President of the International Electrical Congresses, Paris and Turin; General Secretary of the Congress at St. Louis, Mo., U.S.A. Left school in 1875 to become a telegraph operator in the Eastern Telegraph Company. Chief Electrician on Cable Ship 1881; Senior Electrician ship staff, E.T.C., 1886. Principal electrical assistant to Thomas A. Edison, in the laboratories at Orange, N.J., 1886-92. Consulting Engineer in Philadelphia. In partnership with E. J. Houston, of the Thomson-Houston Company, 1893-1900. Engineer-in-Chief when the cables were laid from Vera Cruz to Campeche, 1902. Professor of Electrical Engineering at Harvard University and also at Massachusetts Institute of Technology, since 1914. Corresponding Fellow of the British Association for the Advancement of Science; Honorary Member of the Institution of Electrical Engineers of London, and has twice received one of its premiums for papers. Director of Research Division of the Electrical Engineering Department, Massachusetts Institute of Technology, and Fellow of the American Academy of Arts and Sciences. He has written twenty-three books as author or collaborator, one of which is considered a standard elementary exposition of wireless telegraphy, and is author of more than 120 scientific papers. Honorary degrees include the S.D. of University of Pittsburg and A.M. degree of Harvard University. Some time Chairman and Secretary of Standards Committee, American Institute of Electrical Engineers, President and Secretary of the American Committee of the International Electro-Technical Commission. Has specialised in alternating currents. Address: Harvard University, Cambridge, Mass., U.S.A.

Kitt, A. A.—B. London, 1881. Educ. City of London School and Finsbury Technical College. Joined Marconi Company, 1902. Acted as erecting engineer supervising the installation of many of the earlier ship stations, including those on board the first vessels of the White Star fleet to be equipped. In charge of the installation of the Post Office Wireless Stations at Lochboisdale, Tobermory and Bolt Head. Appointed Chief of the Estimating Department of Marconi's Wireless Telegraph Company, 1911.

Kimura, Shunkichi, Ph.D.—B. 1866. Graduated Scientific College of the Tokyo Imperial University, in the department of Physics, 1888. Lecturer of the First High School in Tokyo. Studied Mathematical Physics in Harvard and Yale Universities, 1893-95. Received the degree of Ph.D. (Yale), 1895. Member of Sigma Xi Society. Visited Holland. Co-founder with Dr. Molenbroek, assisted by Professor Tait, of Edinburgh, and Dr. Joly, of Dublin, of the Association for Promoting the Study of Quaternions and

Allied Subjects. Returned to Japan. Professor of the Second High School in Sendai. Transferred to the Imperial Japanese Navy, 1901, to investigate wireless telegraphy for naval use. Invested with Order of Rising Sun (5th Class), 1903. Invested with Order of Rising Sun (3rd Class) with annuity, 1906. Fellow of the Royal Society of Arts, 1906. Japanese delegate to the International Wireless Telegraph Conference, Berlin, 1906. Retired from the Navy, 1912. Patent Attorney, with office at the Mitsui Building, Honkawayacho, Nihonbashi, Tokyo. Director of various companies, including the Nippon Radio Telegraph and Telephone Company. Engaged in the successful litigation for the General Electric Company against some Japanese firms on the infringement of the patents with respect to the ductile tungsten. Author of several papers on wireless telegraphy. Address: Momosono, Nakano, Tokyo.

King, Professor Louis V.—B. Toronto, Ontario, 1886. Educ. Montreal High School. Gained the degree of B.A. at McGill University with first-class honours and gold medal in mathematics and physics, 1905. Scholar of Christ College, Cambridge, 1906. Graduated at the same University with first-class honours in mathematical tripos. Lecturer in Physics at McGill University, 1910; Assistant Professor of Physics, 1912. Awarded the D.Sc. degree of the McGill University, 1915. Fellow of the Royal Society, Canada. Macdonald Professor of Physics. Investigated submarine acoustics for the Electrical and Submarine Committee of the British Board of Inventions, 1915. Awarded Howard N. Potts Gold Medal of the Franklin Institute for researches in hot-wire anemometry, 1918. Engaged for some time in important researches on the efficiency of fog signal machinery and the measurement and distribution of sound. President of Section III (Mathematics, Physics and Chemistry) of the Royal Society of Canada, May, 1919. Appointed to the Macdonald Chair of Physics, 1920. Address: McGill University, Montreal, Quebec, Canada.

Kojima, Chief Engineer Kiyoshi.—B. Tokyo, January, 1889. Graduated from the Science College of the Kyushu Imperial University, July, 1915. Entered the service of the Department of Communications and engaged in scientific researches at the Electrical Laboratory under Dr. Wichi Torikata. Joined Nippon Radio Apparatus Manufacturing Company as chief of Engineering Department, April, 1916.

Kolster, Frederick A.—B. Geneva, Switzerland, January 13th, 1883. Educ. Public Schools of Cambridge, Mass., and at Harvard University. Assistant to John Stone Stone 1902-08. Took an active part in wireless engineering up to 1912. Joined the scientific staff of the U.S. Bureau of Standards, 1912, and has since been closely associated with the radio work of the U.S. Government. Inventor of a direct reading decimeter and other devices, Fellow of the Institute of Radio Engineers. Attaché to American delegation representing the U.S. in London International Radio Convention in 1912. Member American Institute of Electrical Engineers. Member Cosmos Club, Washington, D.C. Address: U.S. Bureau of Standards, Washington, D.C.

Koomans, Nicolaas.—B. December 18th, 1879, at Delft. Studied at Delft for mechanical and electro-technical engineer, obtaining his certificate, 1901. For one year assistant in applied geometry, and for one and a half years in physics and electrical engineering at the Technical High School at Delft. Entered the Government Telegraph Service. Grad. 1908 at Technical

High School at Delft as Doctor in Technical Sciences on the strength of a dissertation "Regarding the Influence of Self-Induction in Telephone Conducting Wires," containing theses in which are laid down the results of, and the conclusions from, experiments and measurements on Pupin cables of the Dutch telegraph administration. Joint-founder and editor of the *Monthly Review for Telephony and Telegraphy*. Joint-founder and member of the managing board of the Dutch Society for Radiotelegraphy (Nederlandsche Vereeniging voor Radiotelegrafie). Member of the International Electro-technical Commission. Professor in Physics and Theoretical Electrical Engineering at the school of the Dutch Post and Telegraph Administration. Supervises the instruction of all the higher officials. Address: Antonie Duyckstraat 24, The Hague, Holland.

Korn, Professor Arthur.—Professor at Polytechnical High School, Berlin-Charlottenburg. B. Preslau, Germany, May 20th, 1870. Studied at Liepsic and Paris in Mathematics and Physics. Professor of Physics, University of Munich, 1903-08. Best known as the inventor of a system of telegraphic transmission of photographs, and in 1907 the first photograph was transmitted under his system from Munich to Berlin, a distance of 600 kilometres. Inventor of a system of teleradiography and wireless phototelegraphy. Author of "Elektrische Fernphotographie und Aehnliches," Leipzig, 1904, and "Handbuch der Phototelegraphie und Teleradiographie" published in 1911 in collaboration with Dr. Glatzel. Address: Charlottenburg, Berlin Schlüterstrasse 25.

Koto, Major-General, Teizo, Military Engineer.—B. Yamaguchi prefecture, May, 1873. Entered the military service as cadet in the 6th Engineering Battalion, 1892, and promoted to 1st Lieutenant, May, 1898. Entered the Science College of the Tokyo Imperial University as a special student of the School of Artillery and Engineering, 1900, and graduated therefrom 1903. Served in the Russo-Japanese war as the chief of the Field Telegraph Corps, 1904. Promoted Major and appointed an inspector of the Military Technical Dept., 1905. Promoted Lieut.-Major and appointed member of the Military Wireless Investigation Committee, 1910. Proceeded to China for the erection of a radio station on Chinwangtao Island, 1912. Promoted Colonel and Chief of the Communications Dept. of the Tsingtau Garrison, 1915. Engaged in the erection of radio stations at Hankow and Tsinan. Promoted Major-General and Military Engineer, 1919.

Krupp, J. F., Chief of Department, Knight of Dannebrog.—B. Copenhagen, August 16th, 1868. Student 1885. Young lawyer 1891. Head clerk to Criminal Judge at Frederiksberg, 1891. Assistant in the Ministry of Home Affairs, 1894. Assistant to Copenhagen Harbour Administration, 1896-1907. Head clerk to Ministry of Public Works, 1904; Chief from 1912. Vice-President of the Electricity Commission, 1907; Chairman from 1916. Chairman of the Cement Commission, 1917. Member and Secretary of the Telephone Commission of 1917, from 1917; Chairman from 1920. Chairman of the "Gudenaa" Commission and the other Commissions concerning water power plants 1918, and of the Commission regarding Long Distance Radio Telegraph Stations. Address: Frederiksberg Allé 55, Copenhagen V, Denmark.

Kroger, F. H.,—Educ. University of Colorado. Graduated M.S. 1905. Apprenticed to the

Westinghouse Electric and Manufacturing Co., East Pittsburg, 1905. Engineer at Brant Rock Transatlantic station of the National Electric Signalling Co., 1906. Radiotelegraph Adviser to the States Signal Corps (1907), which installed the Inland Radio Station in Alaska. Organised educational courses in electrical engineering and in radiotelegraphy at Cornell University, 1908-11. Joined the International Radiotelegraph Company, New York, 1911. Joined the Marconi Wireless Telegraph Company of America (1919) as division engineer at their factory. Joined staff Radio Corporation of America, 1920. Address: 54, Martense Street, Brooklyn, New York.

Kujirai, Tsunetaro, Professor of the Tokyo Imperial University.—B. 1882. Graduated Electrical College of Tokyo Imperial University, 1907. Some time Wireless Engineer in the Department of Communications, and Assistant Professor of the Tokyo Imperial University. Awarded the Academy prize and medal of the Japanese Imperial Academy. Member of the Institute of Physical and Chemical Research. Address: Tokyo Imperial University, Hongo, Tokyo, Japan.

Langmuir, Dr. Irving, M.A., Ph.D. of University of Gottingen (1906).—B. Brooklyn, New York, January 31st, 1881. Educ. School of Mines, Columbia University; Graduated 1903 as metallurgical engineer. Undertook post graduate work at University of Gottingen under Professor Nernst. Returned to America and became Instructor in Chemistry at the Stevens Institute of Technology, 1906-09. Entered Research Laboratory of G.E.C. at Schenectady, 1909, where his investigations have included Radio Telephone and Telegraphic Apparatus, Tungsten Lamps, Electric Heating Devices, Pure Electron Discharge Apparatus, etc. During the war engaged on submarine problem and developed several successful detecting devices used by the United States Navy. Has been a frequent contributor to various scientific journals and published many scientific works. Addresses: G.E.C. Research Laboratory, Schenectady, New York. 6, Stratford Road, Schenectady, New York.

Latour, Marius.—B. October, 1875, in South-western District of France. Educ. University of Paris and Parisian Ecole Supérieure d'Electricité. For many years consulting Engineer to the General Electric Company of America. Author of numerous inventions in the world of electro-dynamics. Paid special attention to the construction of high-frequency machines, which he originally attempted to design in the shape of monophase or polyphase machines grouped in cascade. Analysed the essential features of machines based on this principle, and showed their analogy and close relationship to those of Professor Goldschmidt. Presented an original paper to the Technical Manager of the General Electric Company at Schenectady, 1904, setting forth the principle of the reception of continuous waves by beats, and this principle of beat reception is to-day in general use. Has specialised in the direction of constructing amplifiers of low and high frequency for wireless-telegraphic reception, for the benefit of the French Société Radio-Electrique, of which he is consulting engineer. Address: 8, Square Desaix, Paris, XVe. Telephone: Saxe 45-83.

Lippmann, Gabriel.—Of the Académie des Sciences at the Bureau des Longitudes. Commander of the Legion of Honour. Director of Laboratory of the Ecole des Hautes-Etudes. Professor at the Sorbonne. President

of the Interministerial Commission on Wireless Telegraphy. Occupied primarily with electrical matters. Inventor of an apparatus employed in Military Wireless Telegraphy for receiving Wireless Time Signals. Foreign Member of the Royal Society of London. Address: Sous-Secrétariat d'Etat des Postes et Télégraphes, Paris.

Litström, Axel Sigurd.—B. Falun, Dalecarlia, September 3rd, 1851. Passed Maturity Examination 1900. Examination of Electro-Technical Branch, Technical University, Stockholm, 1905. Entered the Telegraph Service, 1900. Inspector of wireless installations, 1913. First Engineer at the Radio Division of the Royal Telegraph Administration, Stockholm, 1920.

Ljungqvist, Seth.—B. Falun, Dalecarlia, Sweden, May 5th, 1880. Passed Maturity Examination, 1899, and Examination of Electro-Technical Branch, Technical University, Stockholm, 1901. Entered the Telegraph Service, 1899. Chief of the Radio Division in the Royal Swedish Telegraph Department, Stockholm, 1916. Address: Vonadisvagon 23, Stockholm.

Lodge, Sir Oliver, D.Sc., F.R.S.—B. Penkhall, Staffs, June 12th, 1851. Educ. at Newport (Salop) Grammar School; studied privately for several years. Entered University College, London, 1873. Graduated D.Sc. 1878. Reader in natural philosophy at Bedford College for Women and Assistant Professor of Physics in University College, London, for several years, Liverpool, for nineteen years. The First Principal of Birmingham University, 1900. Knighted, 1902. Original investigations on lightning, the seat of the electromotive force in the voltaic cell, the phenomena of electrolysis and the speed of the ion, the motion of the ether near the earth, and electromagnetic waves and wireless telegraphy. His patent (1897) for syntonic wireless telegraphy was extended for seven years by Lord Parker, and was acquired by the Marconi Co. in 1911. Has held the position of President of the British Association, President of the Physical Society, and of the Society for Psychical Research. Has made many important contributions to the literature of science. Address: Mariemont, Edgbaston, Birmingham.

Lombardi, Dr. Luigi, Professor of Electricity, Royal Polytechnic School, Naples, since 1901.—B. August 21st, 1867, Dronero (Italy). Diploma of Civil Engineering, Royal Engineering School, Turin, 1894; Diploma in Electricity and Gori-Feroni prize, Industrial Museum, Turin, 1891; Professor of Electricity, Zurich Polytechnic School (1891-96), at Industrial Museum, Turin (1897-1900). Publications: The "Scientific Principles of Electricity" and a text-book on Electrotechnics, besides numerous papers on kindred subjects. Author of a study on employment of condensers for transmission of electricity, which obtained Kramer Prize of Lombard Institute. Inventor of a special high tension electrical condenser. Now engaged in research upon electric surges and protective devices. For this purpose the first artificial line for very high tension has been erected in his laboratory. Delegate of the Italian Government at the St. Louis International Congress of Electricity; President of the International Electrotechnical Commission held in Turin in 1911. Address: Via Santa Lucia 173, Naples.

Loring, Commander F. G., R.N., M.I.E.E.—Inspector of Wireless Telegraphy, General Post Office. Entered the Navy in 1882 (retired 1910). Lieutenant on H.M.S. "Victoria" when that vessel was rammed and sunk by H.M.S. "Camperdown" off Tripoli (1893). Received Bronze

Medal of Royal Humane Society for saving two lives. In charge of Admiralty shore wireless stations 1902-08. Admiralty delegate at Berlin International Conference on Wireless Telegraphy, 1906. Appointed Inspector of Wireless Telegraphy, 1908. Post Office delegate at International Conference on Wireless Telegraphy, London, 1912. Technical Adviser to the Board of Trade on Wireless matters at International Conference on Safety of Life at Sea, London, 1914. Address: The Old House, Foot's Cray, Kent.

Lyons, Colonel Henry George, D.Sc., F.R.S.—B. October 11th, 1864. Educ. Wellington College, Director-General of the Survey Department in Egypt 1898-1909, gaining Victoria Research Medal, R. Geog. Soc., 1911. Member of the Meteorological Committee, 1913. European War, Commandant Army Meteorological Services; Acting Director Meteorological Office, 1918-19. Chairman of Sub-Committee "B" on Atmospheres of Radio Research Board of the Department of Scientific and Industrial Research. Keeper, Science Museum, 3, Cambridge Square, W.2.

Machado, Alvaro de Melo, Commander in Portuguese Navy, and Torpedo Operating Officer of the Naval College of Val de Zebro.—B. February 22nd, 1883. Entered Portuguese Naval Service, 1904, and elected Member of the Portuguese Academy of Science for his original design of wireless-controlled torpedo in 1907. In 1915, whilst only Second Lieutenant, became Manager of the Electrical Services of the Marine Arsenal, and was responsible for the direction of the installations made in the National Naval Units and Land Stations of the Navy. Reorganised the dismantled wireless on German vessels confiscated during the war. Received Portuguese Distinguished Service Medal, and made Member of the "Académie Française" in 1917, in acknowledgment of his wireless work. Address: Ministry of Commerce, Lisbon.

Makower, A. J., M.I.E.E.—B. May 9th, 1876. Educ. University College School, Gower Street, and at the College itself, between 1884 and 1895. Studied mathematics at Trinity College, Cambridge, taking his degree, 1898. Proceeded to Technical School, Charlottenburg, Germany, and obtained valuable insight into German methods. Joined the British Thomson-Houston Company, Rugby. Received an appointment at the South-Western Polytechnic, Chelsea, 1904. As head of the Electrical Engineering Department at the Polytechnic, was closely connected with the University of London, of which he was a teacher. At one time Secretary of the Board of Studies in Electrical Engineering, and Chairman of the Board of Examiners in Electrical Engineering. Author of many valuable papers on wireless subjects. Resigned his teaching post and became managing director of Mossay & Co., Ltd., designers and selling agents for commercial electric vehicles, 1918. A member of the Electric Vehicle Committee of Great Britain. Address: 12, Greencroft Gardens, N.W.6.

Makower, Capt. W., M.A., D.Sc.—B. December 6th, 1879. Educ. University College School and University College, London. Took honours degree in Chemistry at the University of London, 1900. His early research work relates to investigations in heat, but on proceeding to Trinity College, Cambridge, 1902, commenced investigations at the Cavendish Laboratory on radioactivity. Elected to a Research Fellowship in the University of Manchester. Subsequently Assistant Director of the Physical Laboratories. Continued these researches until 1917. Joined

the R.N.V.R. as a lieutenant, 1917, and subsequently became captain in the R.A.F. During the war, at the Air Ministry Laboratory in the Imperial College of Science and Technology, working on thermionic valves and other matters connected with wireless telegraphy. Since the Armistice has been engaged on various problems connected with wireless telegraphy and navigation being investigated at the Air Ministry Laboratory. Most of his scientific publications have been in connection with radio-activity, of which, perhaps, the most important are on the subject of radio-active recoil, which he discovered with Dr. S. Russ in 1909, and he was awarded the degree of D.Sc. at London as a result of his early investigations in this subject. Of his other contributions to Science are his work on the Electric State of the Upper Atmosphere and his books on *Radio-Active Substances* and *Practical Measurements in Radio-activity*. Elected a fellow of University College, London, 1912, and for some years past has acted as Recorder of Section "A" of the British Association.

Malgat, Capitaine (of Colonial Artillery) Emile, Technical Adviser in Wireless Telegraphy (since May, 1919), French Colonial Office.—B. Illzach (Alsace), 6th March, 1883. Studied (1902-04), Ecole Polytechnique of Paris. Sub-Lieutenant Colonial Artillery, 1904. Before the war Chief of the Radiotelegraphic Service of French Equatorial Africa. During the war served at the Central Radiotelegraphic Military Establishment.

Marchant, Edgar Walford, D.Sc., M.I.E.E.—David Jardine Professor of Electrical Engineering in the University of Liverpool. B. Kent, 1876. Educ. University School, Hastings, and Central Technical College. Graduated B.Sc. at London University with honours in physics and mathematics, and subsequently took the degree of D.Sc. After serving an apprenticeship appointed Superintendent of Lord Blythwood's Laboratory and Workshops at Renfrew, N.B., 1897, where he carried out many experiments in wireless telegraphy. Leaving Renfrew in 1900, served as chief assistant for one year at the Finsbury Technical College under the late Professor Silvanus P. Thompson. Lecturer in electro-technics at University College, Liverpool, 1901, and on the establishment of a Chair of Electrical Engineering in 1903 was elected the first professor. Closely associated with the late Mr. Duddell in the development of the oscillograph and joint author of a paper read before the Institution of Electrical Engineers on the study of the electric arc by the aid of oscillographs. Author of a number of articles on wireless and cognate subjects, and was one of the British delegates to the Scientific Commission on Wireless Telegraphy, held in Brussels, April, 1914. Vice-President of the Wireless Society of London, Past President of the Liverpool Engineering Society, Past Chairman of the Manchester Section of the Institution of Electrical Engineers. Address: 2, Ivanhoe Road, Sefton Road, Liverpool.

Marchant, W. H.—B. London, March 22nd, 1881. Commenced experimental work in connection with W/T (1904). From 1906-11 he served with De Forest Syndicate, Poulsen Company, and Lepel and Anglo-German W.T. Companies, being chiefly engaged in experimental work. Since 1911 he has devoted himself mainly to literary work and to teaching. Address: 4, Branch Hill Side, Hampstead, N.W.

Marconi, Alfonso.—B. Bologna, 1865. Educ. Bedford Grammar School, England, and Technical Colleges in Florence and Leghorn. Assisted

his brother in carrying out his first experiments in Wireless Telegraphy on one of his father's estates near Bologna. Joined the board of Marconi's Wireless Telegraph Company and the Marconi International Marine Communication Co., Ltd., July, 1909. Address: 75, Harley House, Regent's Park, London, N.W.1.

Marconi, Senatore Guglielmo, G.C.V.O., LL.D., D.Sc., M.I.E.E.—B. Bologna, Italy, April 25th, 1874. Irish on his mother's side. Educ. Leghorn and Bologna. First interested himself in the problem of wireless telegraphy, 1895. Visited England, 1896, and took out the first patent ever granted for a practical system of wireless telegraphy by the use of electric waves. Earliest experiments in England made at Westbourne Park. Shortly afterwards Senatore Marconi made some experiments for the Post Office officials. The Italian Government conferred upon Mr. Marconi the honour of knighthood. Senatore Marconi has been decorated by the King of Italy and the late ex-Czar of Russia, is an honorary doctor of many universities, including Oxford, Glasgow, Aberdeen, Liverpool, and Pennsylvania, besides having received the freedom of the principal Italian cities. In 1909 (in conjunction with Professor Braun) he was awarded the Nobel Prize for Physics. Elected a senator in the Italian Parliament (1914), being formally introduced to the Assembly on March 27th, 1915. On July 24th, 1914, the King bestowed upon him the Honorary Knighthood of the Grand Cross of the Victorian Order. He also holds many scientific awards granted by various societies and institutions, of which we may quote as a comparatively recent instance his presentation by the Royal Society of Arts, on April 12th, 1915, of their Albert Medal. Immediately on the declaration of war by Italy, Senatore Marconi was given the rank of Lieutenant in the Italian Army. He has been employed on important military missions to England by the Italian Government, and on July 29th, 1916, was promoted Captain "for exceptional services." At the beginning of September, 1916, he was transferred from the Italian Engineer Service to be temporary Commander in the Navy. Senatore Marconi visited the United States, 1917, as Member of the Official Mission sent by Italy to the U.S.A. Government. The University of Columbia invested him with the honorary degree of Doctor of Science on June 6th, 1917. The Franklin Institute of Philadelphia conferred their Franklin Gold Medal upon Senatore Marconi on May 15th, 1918. On June 26th, 1919, Senatore Marconi was appointed by H.M. the King of Italy Plenipotentiary Delegate to the Peace Conference at Paris, and in this capacity he signed the Peace Treaties with Austria and Bulgaria. At the end of 1919, Senatore Marconi was awarded the Italian Military Cross. Senatore Marconi, who is decorated with the Italian "Ordine Civile" of Savoy, has been nominated by the King of Italy to be a member of the Supreme Council of the same Order on the proposal of Signor Giolitti. In addition to being Chairman of the Board of Directors of the Marconi Company, Senatore Marconi is Chairman of the Banca Italiana di Sconto and of the Lloyd Sabaud Steamship Company.

Mariott, Robert Henry, Expert in Radiotelegraphy, U.S. Navy.—B. 1879. First experimented with wireless telegraphy in 1899, while student at the Ohio State University, U.S.A. Employed by the American Wireless Telephone and Telegraph Company, Philadelphia, 1901, for which company the erected stations

at Breille, Galilee and Barnegat, N.J. Chief Engineer of the Pacific and Continental Wireless Telephone and Telegraph Company. Installed three stations in California, at Avalon, Santa Catalina Island, and San Pedro, 1902. Employed with the Carstarphen Electric Company at Denver, Colorado, 1903. Constructed stations for the American De Forest Wireless Telegraph Company, and its successor, the United Wireless Telegraph Company, in Colorado, Wyoming, and Texas, 1905. In charge of this Company's construction and maintenance, 1910. Entered Marconi Wireless Telegraph Company of America, 1911. Entered the U.S. Government service as Radio Inspector, 1912. Chairman, 1916. Seattle Section Institute of Radio Engineers, Member of the Committee on Standardisation. Fellow and Past-President The Wireless Institute, 1909-12.

Marvá, General J.—B. 1846. Practically the pioneer of Wireless Telegraphy in the Spanish Army. Founder of first Spanish Aerodrome at Cuatro Vientos. Author of many scientific works (*Mecánica aplicada a las construcciones*, *Tracción en Vías ferreas*, etc.), Member, Royal Academy of Sciences, and International Association for experiments of materials.

McLeachlan, Norman W., D.Sc. (Eng.), M.I.E.E.—Associate of the Heriot-Watt College and a D.Sc. (Engineering) of the University of London. Author of many papers on various subjects in the *Journal of the Institution of Electrical Engineers* and other scientific journals. Research Engineer in service of Marconi Company. B. Longtown, Cumberland, 1888. Educ. Carlisle Grammar School and the George Watson and the Heriot-Watt Colleges, Edinburgh. Served apprenticeship with Messrs. Bruce, Peebles and Co. In 1909 was appointed Lecturer in Engineering and Mathematics at Newcastle-on-Tyne. In 1913, Superintendent of a Technical Institute, and Supervisor of Classes in Engineering Subjects in the Liverpool Technical Institutes. During the war carried out much research work for Government in aeronautics and anti-submarine devices, organising a laboratory at Air Ministry for research on liquid and gaseous oxygen apparatus for aircraft use. After the Armistice engaged in magneto research at the National Physical Laboratory, Teddington. Address: Marconi Research Laboratories, Hall Street, Chelmsford.

McMichael H. Leslie, Honorary Secretary, Wireless Society of London.—B. Birkenhead, 1884. Educ. Ackworth and Technical College, Birmingham. Apprenticed to Messrs. Duckett and Brown, Electrical Engineers, Birmingham, afterwards taking control of one branch of the business. Among the first to hold a receiving and transmitting licence in London, and had a highly efficient station in London prior to 1914. His work lay chiefly in the direction of sensitive synthetic crystals, and with Mr. R. H. Klein he was responsible for the synthetic crystal "Radiocite." One of the moving spirits in the foundation of the Wireless Society of London, and has taken an important part in its management since its origin; first in the office of Vice-Chairman, and since 1919 as Honorary Secretary of the Society. During the war served in the Wireless Instructional Section of the R.A.F. Member of the Institute of Radio Engineers and a Director of more than one commercial concern. Address: 32, Quex Road, West Hampstead, N.W.6.

Meissner, Alexander.—B. Vienna (Austria). Studied at Technical High School and University,

Vienna. Joined the Laboratory of the Telefunken Company, Berlin, 1907, and since that time has taken a very prominent part there in the development of the technique of wireless in Germany. (Introduction of the Flat-coil, the most favourable diameter for high-frequency coils, musical quench sparks, directional sparks, high-frequency machine, Telefunken compass, interference-reception with the detector, direct current cathode valve relay, for Morse reception, etc.). Introduced the production of oscillations with cathode valves, 1913, as well as the audiou with reverse coupling. Has published a series of articles on his work in different periodicals.

Meyer, Niels Rasmussen.—Director of Telegraphs to Danish Government since 1897. B. Rendsburg, Holstein, 1856. Educ. Polytechnic Academy, Copenhagen. Entered as a cand. Polyt. 1878, and during same year became assistant in building department of Royal Dockyard. State Railway traffic learner (1880); telegraph engineer attached to the State Railways in Jutland and Funen (1882). Holds several Danish Orders and number of foreign decorations. Address: Sigridsvej 4 Hellerup, Copenhagen.

Minohara, Dr., Lieut.-Com. (of Ordnance), Tsutomu, Professor at the Naval Academy.—Graduated from the Tokyo Imperial University, 1907. Entered Naval Arsenal of Maizuru and Kure and engaged in the manufacture of electrical arms and equipment of radiotelegraphy. Member of the Wireless Research Laboratory in the Electrical Department of the Arsenal, 1912. Proceeded to France and Germany to study, 1914. Ordered home in consequence of the outbreak of the European war and resumed service at the wireless laboratory. Inspector of post-bellum condition of radiotelegraphy amongst the Allied Powers, 1917. Returned to Japan, 1918, and assumed service at the wireless laboratory again. Now engaged in the equipment of radiotelegraphy aboard war vessels and merchantmen and construction of high-power land stations. Appointed to serve in the Department of Communications, 1919.

Monckton, C. C. F.—B. Great Malvern. May 8th, 1867. Educ. at Uppingham and Malvern Colleges, and at the Central Institution of the City Guilds. Employed by the Brush Electrical Engineering Company, from whom he passed to Messrs. Boustead Brothers, of Ceylon. Filled Government appointments of Jamaica and Trinidad. Superintendent of Telegraphs and Telephones to the Government of Fiji, 1911. Censor of telegrams during the war. Superintended the erection of the first Colonial Wireless Stations in the West Indies, 1904. Author "Radiotelegraphy" (1907). Acts in an advisory capacity to the High Commissioner for the Western Pacific with regard to all matters relating to wireless in the territories under that official's jurisdiction. Address: Suva, Fiji Islands.

Montefinale, Commander G., R. Italian Navy.—B. 1881. Educ. at Technical Colleges in Italy. Entered Naval Academy, Leghorn, 1899. Officer of the R.N., 1903. First appointment on H.I.M.S. "Andrea Doria," one of the first warships fitted with W/T. Assisted on board this vessel at important experiments in Adriatic and Ionian seas while Mr. Marconi and Marquis Solari experimented with new receiving devices at Ancona. W/T teacher at the R.N. Telegraphist School, 1908-10. Landed in Benadir coast, 1911, where he took part in erection of high-power Marconi station at Mogadiscio.

During the Turkish-Italian war served in the Red Sea flotilla blockading Arabian coasts as W/T officer. Director of Radiotelegraphic service in the Italian Somaliland, 1912-14, visiting the whole region, taking part in all the most important occupations and establishing new wireless links in the boundary zone (Mahaddei-Uen, Iscia Baidoa, etc.). After a period of studies at Leghorn served in the Dreadnought squadron for a long period of the war. In December, 1916, while attached to the Inter-allied staff of Brindisi, sent to Red Sea as Director of Erytrea W/T service. Remained in the Marconi H.P. station of Massawa till the Armistice, co-operating with British authorities in Aden and Egypt to establish new links. Constructed a duplex station at Asmara for metropolitan W/T service. During the summer, 1918, gave a brilliant demonstration of long distance reception in Abyssinia. Chief of W/T Laboratory and Department of Spezia, June, 1919. Author of several papers on wireless telegraphy. Active correspondent of various periodicals and reviews. Member of the specialist body of the Italian Navy.

Moreno Quesada, D. Manuel, Lieut.-Com., Spanish Royal Navy.—Sub-Director of the Compañia Nacional de Telegrafia sin Hilos, Madrid, where he carried out duties as Chief Engineer until 1st June of this year. Engaged in wireless work since the beginning of the application of this science in Spain. Besides the works relating to his career at the Spanish Naval School, he has passed the courses of Electrical Engineer at the London Central Technical College. One of the most notable officers of the Spanish Navy, having distinguished himself in the North African campaign. Granted Cross of Maria Cristina, one of the most important Spanish decorations. Has been also a representative of the Spanish Foreign Ministry in International Radiotelegraph Conferences.

Mullard, S. R., M.B.E., A.M.I.E.E.—B. 1883. 1908, Assistant Works Manager to Société Anonyme des Usines Pintsch. 1910-15, Head of Research Laboratory Edison & Swan Electric Co., Ltd., during which period invented and developed Pointolite Tungsten Arc Lamp. 1916-18, Lieut. R.N.V.R. att'd. R.N.A.S. 1918-19, Capt. R.A.F.; Head of Wireless Telegraphy Section at Air Ministry Laboratory, Imperial College of Science, S.W.7. 1919-20, S. R. Mullard, Wireless Valve Development and Construction, Contractor to Admiralty, War Office, Royal Air Force, and Post Office. September, 1920, Managing Director The Mullard Radio Valve Co. Club: R.A.F. Club. Address: Orient House, New Broad Street, E.C.2.

Nally, Edward Julian, President and Director Radio Corporation of America and Pan-American Wireless Telegraph and Telephone Company.—B. in Philadelphia, April 11th, 1859. Public school education. Married Lee Warren Redd, of Lexington, Kentucky, June 10th, 1897. Pioneer in different modes of communication in America. Started as a messenger boy for Western Union Telegraph Company, in St. Louis; later chief clerk to Superintendent, Minneapolis, Minnesota; appointed General Superintendent, Postal Telegraph-Cable Company, Chicago, 1890. He served this company for more than twenty years, being elected first Vice-President and General Manager, and Director, New York, April, 1907. Left service of Postal-Telegraph-Cable Company, 1913, to accept the position of Vice-President and General Manager of the Marconi Wireless Telegraph Company of America. 1919, elected President and Director, Radio Corporation of America.

Clubs: Caxton, Brothers of the Book, Lawyers, Pennsylvania Society, American Irish Historical Society, American Geographical Society, National Geographic Society, Ends of the Earth. Residence: The Trees, Ossining, N.Y. Business address: Woolworth Building, New York.

Navarro y Ortiz, D. Benito, Major, Spanish Royal Engineers.—Chief of the Wireless Service of the Army permanent land stations (1918). In 1913 took charge of the Spanish Army Station of Carabanchel EGC (Madrid), until 1918. Decorated by the Spanish Government with the White Military Cross (December, 1919) for his knowledge and merit in wireless matters. One of the most distinguished among the Spanish Royal Engineers in connection with Wireless Telegraphy. Has largely contributed to the wide development of this important scientific branch in Spain.

Nicholls, Lt.-Col. Hon. Frederic, J.P., F.R.C.I. (1911). President Marconi Wireless Telegraph Co. of Canada, Ltd.—B. England, November 23rd, 1856. Educ. Stuttgart, Germany. Went to Canada 1874. Founder of "Canadian Manufacturer," the then Official Organ and Spokesman of the manufacturing interest in Canada, of which he was editor and proprietor until 1893. Consul for Portugal. President Toronto Press Club, 1890. President Athenæum Club, 1893. Life Member Board of Trade. Hon. Member Canadian Press Association. Member Executive Committee, Canadian Manufacturers' Association. Gazetted Hon. Lieut.-Col., October 17th, 1914. Appointed to Senate January 20th, 1917. President and or Director of many industrial and electrical concerns. Conservative; Anglican. Clubs: Bankers' Club of America, New York; York, Toronto; Albany; Engineers'; etc., etc. Address: 79, St. George Street, Toronto, Ontario, Canada.

Noble, Sir William, Engineer-in-Chief to the British Post Office.—Commenced his career in Aberdeen Telegraph Office as a telegraphist. In 1893, Engineer for the north-east area of Scotland with headquarters at Aberdeen. In 1897 promoted to Headquarters, London, as First-class Engineer. Subsequently successively Technical Officer, Assistant Superintending Engineer, London, Staff Engineer at Headquarters, Superintending Engineer, London, and in 1912 Assistant Engineer-in-Chief, succeeding to the premier position in June, 1919. In 1919 the King of the Belgians created him a "Chevalier de l'Ordre de la Couronne" for "constant and generous help" during the war. Knighted June, 1920. Address: General Post Office, London, E.C.

Norman, Major the Rt. Hon. Sir Henry, B.A., F.R.G.S., A.M.I.E.E., 1st Bt. cr. 1915, Kt. cr. 1906, M.P. (L) Blackburn since 1910. Chairman of Imperial Wireless Telegraphy Committee (appointed November, 1919).—B. Leicester, September 19th, 1858. Educ. privately in France; Harvard University (B.A.); Leipzig University. Officer of Legion of Honour; Commander of Order of the Saviour; Officer of S.S. "Maurice" and "Lazare." Assistant Postmaster-General, 1910; Chairman War Office Committee on W.T (1912); member of Committee on National Telegraphic Research and P.O. Telegraph Organisation Committee; member of British Association Committee of Radiotelegraphic Investigation and of International Committee of Radiotelegraphic Research; Vice-President of Wireless Society of London; Fellow of Physical Society; Fellow of American Institute of Radio Engineers; Liaison Officer with French Government for Military Inventions; Vice-Chairman

Imperial Communications Committee, and Chairman of Wireless Sub-Committee. Address: The Corner House, Cowley Street, S.W.1.

Orme, Major Robert, B.A.—B. at Bray (Ireland), October 20th, 1865. Educ. in Irish schools and graduated B.A. at Trinity College, Dublin. Initiated career by taking up Electrical Engineering under Hugh E. Harrison at Hammonds College, and then apprenticed to Anglo-American Brush Company. Since 1900 concentrated chiefly on wireless telegraphy and atmospheric electricity. Granted commission in R.F.C., January, 1915, organised and was given command of the Wireless School, Brooklands, November, 1915. Moved himself and his staff from Brooklands to Biggin Hill in September, 1916, where they were constituted first as the Wireless Testing Park and later as the Experimental Establishment, R.F.C. Address: Hollycroft, East End, Newbury, Berks.

Pannill, Charles Jackson.—B. Petersburg, Va., May 13th, 1879. Entered Navy 1898. Chief Telegraphist of United States Coast Signal Service. Entered service of Professor Reginald A. Fessenden, 1902. Conducted experiments in radio communication across Hampton Roads. Installed communication by radio between New York and Philadelphia, 1903. Installed first radio outfit on United States battleship. Conducted experiments between stations of General Electric Company at Lynn and Schenectady; also between Brant Rock, Mass., and Machrihanish Bay, Scotland. Holds commercial first-grade licence No. 1. Entered service of United Wireless Telegraph Company as Division Superintendent, 1909. Erected shore radio stations on Great Lakes, later in charge of division south of New York. Entered service of Marconi Wireless Telegraph Company of America, 1912. Superintendent, Southern Division. Entered service of United States Government, 1914, as expert radio aid, Naval Radio Service. Promoted to Assistant to Director Naval Communications in charge of commercial radio service, 1917. Now General Manager, Independent Wireless Telegraph Company, New York. Fellow of the Institute of Radio Engineers. Member Washington Society of Engineers. Member of the Geographical Society.

Parker, J. N.—Representing Indian Post and Telegraph Department in England at the India Stores Depot, Belvedere Road, London, S.E. Son of the late Major-General N. F. Parker, of the Bengal Army. B. July 6th, 1881, in Calcutta. Educ. Clifton College and the Royal Indian Engineering College, Coopers Hill. Passed out of the latter institution (1902) with diploma of Associate. Joined Indian Government Telegraph Department. Appointed to Electrical Engineer's Office, Calcutta, January, 1904. Accompanied Mr. M. G. Simpson, then Electrical Engineer-in-Chief, to Burma, February, 1904, to assist in preliminary wireless experiments. Continued his connection with the Electrical Engineer's Office and the technical side of telegraph work, which included the erection of several of the 30 kw. Marconi stations belonging to the Department. Superintendent Indian Wireless Telegraph Stations, 1914-19. Represented the Post and Telegraph Department at Poona in connection with the erection of the Imperial Chain Station, until work stopped early in 1915. Address: India Stores Depot, Belvedere Road, Lambeth, S.E.1.

Pedersen, P. O., Professor in the Royal Technical College, Copenhagen. B. at Sig, near Varde, Jutland, June 10th, 1874. Entered Royal Technical College, Copenhagen (1892). Cand.

Polytechnic (1897); Chief Engineer of Telegrafonen, Ltd. (Poulsen Patent), 1899-1902. Gold Medal Danish Society of Sciences (1907). Lecturer at the Royal Technical College, Copenhagen, and Professor from 1912. On board of Dansk Telegrafonfabrik (Danish Telegraphone Co., Ltd.), 1903-12, as well as on Elektroteknisk Forening (Electrotechnic Association) from 1910; Chairman from 1916. President Danish Institute of Civil Engineers, 1902. Director of Det Kontinentale Syndikat for Poulsen Radiotelegrafi (Continental Syndicate for Poulsen Radiotelegraphy) from 1911-19. Member of International Electrotechnical Commission. Fellow Inst. of Radio Engineers since 1915, Fellow Am. Inst. Electrical Engineers since 1920, and a Fellow Royal Danish Academy of Science since 1917. Member of the Telephone Commission (1917), of the Control Committee of licensed Telephone Companies, of the Commission on the training of radio operators, and of the Radio Commission of 1920. His contributions to electro-technical literature have been both important and numerous. Amongst those of recent appearance we may enumerate the following: "Om Poulsen-Buens Teori" (Copenhagen, 1917); "On the Theory of the Poulsen Arc" (*Proc. Inst. Rad. Eng.*, New York), 1917 and 1919; "Poulsen-Buens Virkemaade," *Fysisk Tidsskrift*, Vol. xvii (Copenhagen, 1918); "Den Elektriske Buens Elektroteori" (*Elektrotekniker*, Copenhagen, 1917); "The Lichtenberg Figures" (Copenhagen, 1918); and "Townsend's Teori for Støedionisation" (Copenhagen, 1918). Address: Amalievej 1, Copenhagen, V. Denmark.

Penido, Antonio Nogueira, Director General of Brazilian Telegraphs (since 1918).—B. September 25th, 1864, at Juiz de Fora, Minas Geraes. Civil Engineer of the "Escola Polytechnica" of Rio de Janeiro (diploma March, 1886). Was engaged in the construction of the Central Railway of Brazil; the Recife-Cuaruru Railway, the Sorocabana Railway; port works of Rio de Janeiro and works at Saneamento of the town of Juiz de Fora. Successively Engineer of Public Works of the State of São Paulo, Chief of Traffic of the Sorocabana Railway, Chief Engineer of the Itapura-Corumbá Railway, and Inspector-General of the Mogiana Railway.

Petavel, Sir Joseph Ernest, K.B.E., D.Sc., F.R.S., M.I.Mech.E., A.M.Inst.C.E., Director National Physical Laboratory, Teddington.—B. 1873. Educ. University College, London. Scientific Research at the Royal Institution and at the Davy Faraday Laboratory, 1896-98. John Harling Fellow, Owens College, Manchester, 1900-03. Scientific Manager, Low Temperature Exhibit of the British Royal Commission for the St. Louis Exhibition, 1904. Professor of Engineering and Director of the Whitworth Engineering Laboratories, University of Manchester, 1908-19. Publications: *Papers in the Philosophical Transactions of the Royal Society*, "The Philosophical Magazine," "Engineering," etc. Member of Aeronautical Research Committee and other Government Committees connected with Aviation. Member of Committee on Imperial Wireless Scheme Clubs: Atheneum; Royal Automobile, Primrose Club, London. Address: National Physical Laboratory, Teddington, Middlesex.

Petersen, Harmod.—Chief Engineer and Inspector of Wireless Telegraphy, Norwegian Government Telegraph Department. B. Christiania, 1875. Graduated as electrical engineer at Bergen Technical College, afterwards attending the Polytechnic University at Karlsruhe, Baden. Chief of the Telegraph Schools, 1900-13.

One of the pioneers of wireless telegraphic expansion in Norway. Superintended the first radio experiments, 1901. Later on formulated schemes for all wireless land stations along Norwegian coast. Member of the first International Conference on Wireless Telegraphy, Berlin, 1906. Engineer-in-Charge during the erection of a wireless station at Spitzbergen (1911), which communicates with a similar station in the North of Norway. Remained in charge during its first winter. Chief of the Norwegian Wireless Department, 1913. Superintends the land stations. Also Government Wireless Inspector, controlling all the ship stations of Norway. Published a number of technical books for instructional purposes, principally on the subject of telephony and telegraphy, both wired and wireless.

Petit, Gaston Emile.—Electrical Engineer in the French Postes et Télégraphes; Technical Director of the Compagnie Générale de Radio-télégraphie, B. Paris, 1877. Chief of the Service of Wireless Telegraphy at the French Postes et Télégraphes, 1905-11. Member of the International Conference on Wireless Telegraphy, Berlin, 1906.

Pickard, Greenleaf Whittier, A.A.A.S.—Electrical Engineer. B. Portland, Me., February 14th, 1877. Educ. Westbrook Seminary, Lawrence Scientific School, Harvard, and Mass. Institute of Technology. Has made a special study of wireless telegraphy and telephony, and has taken out many United States and foreign patents for wireless inventions. Executed good pioneer work in radiotelephony, and still actively engaged in this branch of the science. Began radio work, 1899, at Blue Hill Observatory, Milton, Mass., under a grant from the Smithsonian Institution. Became associated with Harry Shoemaker, 1901. On the engineering staff of the American Telephone and Telegraph Company, 1902-06. Developed a practical system of radiotelephony, obtaining successful speech transmission without wires, 1902. From 1906 until the present date has been connected with the Wireless Specialty Apparatus Company as consulting engineer. Practices extensively as patent expert in wireless patent litigation. Consulting electrical engineer to the Huff Electrostatic Separator Company. Fellow of the American Institute of Electrical Engineers. Member of the American Chemical Society. Member of the Society of Chemical Industry. Member of the Institute of Radio Engineers. Club: Engineers'. Private address: Newton Centre, Mass. Office address: C and Fargo Streets, Boston, Mass.

Pletts, John St. Vincent.—B. Ryde, I. of W., 1880. Educ. locally and at Central Technical College. Joined Marconi's Wireless Telegraph Company, Ltd., 1899. Constructed wireless stations in Hawaii, Labrador, the Congo, Russia, and the Far East. Deputy Chief of Staff, 1906. Head of that Company's newly formed Patent Department, 1910. Expert in Cryptography at the War Office, 1911. Consulting Engineer, 1919. Member of various scientific societies, and author of a number of technical articles. Address: Marconi House, W.C.2, and Shalston House, Ewell Road, Surbiton.

Poulsen, Valdemar, Eng. D.S., D.Ph. (h.c.) Leipzig (1909).—B. Copenhagen, November 23rd, 1869. Studied at University of Copenhagen, 1889-93. Entered technical department Copenhagen Telephone Company, 1893, and for a number of years superintended electrical testing operations. Holds Medal for Merit in gold with crown. Collaborated with Prof. P. O. Pedersen

for many years. Member of the board of the Telegrafonen, Ltd. (Patent Poulsen), 1902-16. Joined board of Dansk Telegrafonfabrik, Ltd., 1909, and that of Poulsen Wireless Telephone and Telegraph Company, U.S.A. (1909-11). Fellow of Danish Society of Sciences (1914). Grand Prix at Paris in 1900 for telephone work. Initiated in 1903 a method of generating continuous electrical waves. Danish Society of Sciences' Gold Medal (1907). Publications: "Une Méthode pour Produire des Oscillations non Amorties et leur Emploi dans la Télégraphie sans Fil"; and "La Téléphonie sans Fil: Rapport Officiel au Congrès International des Applications Electriques," Turin, September, 1911 (Copenhagen, 1912). Address: Gentofte Møllegaardsvej 6, Copenhagen.

Prince, Major Charles Edmond, O.B.E. Technical Manager of the Aircraft Department, Marconi's Wireless Telegraph Company, Ltd.—B. Capetown, 1874, son of Rev. E. B. Prince sometime Vicar of Tor Mohun, Torquay. Educ. Clifton College (Science Exhibitioner) and Faraday House. Married in 1908 Amelia Ella Verner. Published 1905 "Ode on Poetry and other Poems" (Harrison, Pall Mall), etc. Joined Marconi's Wireless Telegraph Company, Ltd., 1907, specialised in Research Work and particularly in Wireless Telephony. Demonstrated first Marconi Field Station in Italy and Switzerland, 1909. Instituted important improvements in Bellini-Tosi Direction Finding System. Granted commission in Westmorland and Cumberland Yeomanry, 1911. Attached R.F.C., April, 1915. Developed at Brooklands in same year first aircraft wireless telephone. Gazetted experimental officer (First Class), December, 1915. Mentioned in despatches 1918, and in the same year appointed Major. Granted M.B.E. 1918, O.B.E. (Military Division), 1919. Addresses: Stubbings Manor, Burchetts Green, Berks.; 63, Drayton Gardens, London, S.W.

Pupin, Dr. Michael I., Director of Research Laboratory, Columbia University, New York, ex-President, Institute of Radio Engineers.—B. Hungary, October 4th, 1858. Went to the United States 1874. Studied at Columbia University. Graduated 1883. Study continued at Cambridge, England, and Berlin. Returned to the United States. Professor of Mathematical Physics at the Columbia University, 1891. Among his first original work may be mentioned the development of electrical resonance, before the introduction of wireless telegraphy. Patents issued to him on electrical selectivity were licensed to Marconi's Wireless Telegraph Company, 1903. Has worked extensively in the development of his inventions in connection with telephones and telegraphs, and many of his improvements are known by his name throughout the world. Has recently been engaged in the development of a new method of electrical selectivity to be used in connection with wireless telegraphy. Has also been engaged in research work in wireless telephony.

Ramsing, Holger U., Lieut.-Col., Danish Engineer Corps. Chief of Military Wireless Service, Denmark, since November, 1918.—B. Copenhagen, March 13th, 1868. Sub-Lieut., 1888, and Lieut. Engineer Corps, Lieut. Dan. West Indian Forces, Inspector of Public Works, Land Surveyor and Director of Government Telegraphs, Danish West Indies, 1895-1900; Capt. Engineer Corps and Chief of 4th Engineer (Telegraph) Company, 1901-06; Administrative Engineer-of-Fortification of Fortress of Copenhagen, Western District, 1907-18. Teacher of Fortification Military Academy since 1908. Member of Technical

Committee of Engineer Corps since 1916. Member of Military Telegraph and Telephone Commission, 1901-07, and since 1918. Lieut.-Col. Engineer Corps and Chief of Telegraph Battalion (3rd Eng. Batt.), 1918. Address: Ribegade 8, Copenhagen.

Bogo, Capt. T. R. Moraes, Chief of the Radiotelegraphic Service, Brazilian Navy.—B. Rio de Janeiro, March 8th, 1882. Completed training at Naval Academy, 1900. Served for a few years on ships, studying electricity and torpedoes. Torpedo Lieutenant in the Professional Torpedo School. Began studying radiotelegraphy when first wireless stations were installed in Brazilian Navy, 1904. Perfected his knowledge of the subject on special trips to Europe and America. Assistant in the Radio Department of the Navy on various occasions. Appointed (1914) Chief of the Radio Service, a post which he still holds. Address: 22, Ipanema Copacabana, Rio Janeiro.

Bendahl, R. H.—B. 1878. Electrical engineer in the Royal Swedish Navy Department, 1909; attached to the Swedish Board of Admiralty, 1912: wireless expert attached to the Swedish Navy. Knight of the "Nordstjärna" Order, and holder of several foreign orders. Address: Djursholms, Ösby, Sweden

Reo-h, Alexander, Wireless engineer, American Marconi Company.—B. Sheffield, England, 1884. Educ. Sheffield Science School and Sheffield University College. Graduated in electrical engineering, 1902, winning the Mappin Medal and Prize in that year. Entered the service of the English Marconi Company in June, 1902, and undertook construction and operating work for that company in England, Holland, Germany, and Egypt. Appointed engineer with the Canadian Marconi Company, 1905. From 1909 to 1911 temporarily in complete charge of the business of the Canadian Marconi Company, during which time that company's contract with the Canadian Government for the operation of the Great Lakes stations was negotiated, as well as the contract between the Canadian Company and the Newfoundland Government. Chief Engineer of the Canadian Marconi Company, 1917, and at the beginning of 1918 he relinquished this position to take an appointment on the engineering staff of the American Marconi Company. Appointed, 1920, Plant Engineer, Radio Corporation of America. Address: 233, Broadway, New York.

Ribeiro, Alvaro Nunes, Commander and Director, Radiotelegraphic Station of Monsanto.—B. Lisbon, 1879. Educ. National Lyceum and the Lisbon Polytechnic School. Cadet in the Naval School, 1898. Completing his training there, was commissioned to join an expeditionary force to the Zambesi. On his return to Portugal he was appointed naval instructor at the Torpedo and Electrical School, where he devoted himself to the study of wireless. Leading member of the Naval Commission on Organisation, 1910, where he strongly advocated the establishment of a naval staff for war purposes. Member of Parliament. Member of the Commission on Posts and Telegraphs. Secretary to the Naval Commission. As a member of the Posts and Telegraphs Commission he fathered a Bill for the organisation of Portuguese Colonial Wireless, and as soon as the Act had been passed by Parliament a contract to carry out its provisions was concluded with the Marconi Company. Commanded the vessels "Berrio" and "Patrao Lopez" engaged in rescue work, when he met with a serious accident trying to save a cruiser.

As a consequence returned to shore service, where he organised the Portuguese Coast Service, and formulated a code of regulations. Address: R. Vieira da Silva 64, Lisbon.

Rinde, K. Werner J., son.—B. Falun, 1882. Educ. Falun and Göteborg University. Telegraph clerk, controller, etc. Studied W/T and telephony systems and traffic, during voyages to Holland, Great Britain, Germany, Austria, Italy, and U.S.A. 1912-13 (autumn 1912 for some months with the Marconi Companies in Rotterdam and at sea). Teacher at W/T school of Royal Swedish Telegraph Board from 1914. Supt. of the W/T station at Vaxholm, Sweden, 1914-16, of Karlsborg Radio since beginning of 1917. Address: Karlsborg, Sweden.

Robinson, James, M.Sc. (Dunelm), Ph.D. (Göttingen).—B. September 9th, 1884. Studied Mathematics and Physics at Armstrong College, University of Durham and at the University of Göttingen. Pemberton Fellow of Armstrong College, University of Durham, 1906-09. Publications (Physics): *Dust Figures in Kundt's Tube* (papers in "Physikalische Zeitschrift," *Philosophical Magazine*, *Proceedings of the Physical Society of London*, between the years 1908 and 1913). *Absorption of Cathode Rays in Gases* (papers in "Annalen der Physik," "Proceedings of the Philosophical Society of the University of Durham, in 1910). *Photoelectric effect* (papers in the "Philosophical Magazine," 1910-15). *Papers on Directional Wireless and Reception on Aircraft* (in "Radio Review"). Appointments: Armstrong College, Demonstrator in Physics, 1906-07; Lecturer in Mathematics, 1909-10. University of Sheffield, Lecturer and Demonstrator in Physics, 1910-12. East London College, University of London, Lecturer in Physics, 1912-15. Examiner in Physics, University of London, 1912-15. Wireless experience: Commenced in 1915 in the R.N.V.R., as Lieut., R.N.V.R. In 1917 attached R.N.A.S. for experimental W/T work. Various patents. Address: Chief Experimental Officer at the Instrument Design Establishment, Biggin Hill, Kent.

Robinson, Samuel S., Rear-Admiral U.S. Navy. Member of the Institute of Radio Engineers.—B. May 10th, 1867. Graduated from the U.S. Naval Academy, 1888. In personal charge of the Division of Radiotelegraphy in the Bureau of Equipment, Navy Department, 1904-06, and in general charge from 1909-11. Author of the "Manual of Wireless Telegraphy for Naval Electricians," first issued in 1906, and revised for several subsequent editions. Address: Boston Navy Yard, Boston, U.S.A.

Rodrigues, Apolinio Gomes da Silva, Flag Captain in the Portuguese Navy.—B. May 31st, 1866. Finished education and entered Portuguese Navy in 1886. Became Professor of Electricity and Torpedoes at the Naval College in 1902, and Professor of Electricity of Naval Auxiliary College, 1903. Received his present rank of Flag Captain in 1907. Entrusted with embodiment of Naval Regulations concerning wireless in 1909. Elected Member of Advisory Committee on wireless in the Portuguese Navy in 1910. Address: Portuguese Admiralty, Lisbon.

Rydin, Sven Ludvig Herman.—Since 1905 Director of Telegraphs in Sweden.—B. Upsala, October 2nd, 1861. Graduated in Law, Upsala, 1885, solicitor's clerk 1887, Registrar in the Lower House 1888-90, Registrar in the Upper House 1890-97. Auditor attached to the Swedish State Railways 1890-97, Registrar attached to the Board of the State Railways 1895-96,

assistant to the Director of the State Railways 1896-97, Member of the Board of Telegraphs 1897-1902, Under-Secretary of State for Home Affairs 1902, Commander of the "Nordstjaerna." Order and holder of several foreign decorations. Address: Kungl. Telegrafstyrelsen, Stockholm.

Salmond, Captain J. S. C., R.N.—B. 1882. Entered "Britannia," 1897, left 1898. Served in China in "Barfleur," landed in the Boxer operations, 1900. Mentioned in despatches. Served in Pacific in "Grafton" and "Flora." Qualified as torpedo lieutenant, 1905. Served in Atlantic in "Antrim" as lieutenant (T.). Served in Wireless Telegraphy Experimental Department, "Vernon," 1908-11. Squadron Wireless Telegraphy Officer, 2nd Battle Squadron in "Hercules," 1911. Fleet Wireless Telegraphy Officer, Home Fleet (later Grand Fleet) in "Neptune" and "Iron Duke," 1912-15. Wireless Telegraphy Assistant to D.N.O. Admiralty, 1915-17. In command of "Odin" in Red Sea, 1917-19, mentioned in despatches for operations against Turkish forces in the "Asir" and "Yemen." Serving in Signal Division, Admiralty, on Wireless Telegraphy duties. Member of Radio Research Board. Address: Admiralty, London, S.W.1.

Saltzman, Charles McKinley, Brigadier-General, Executive Officer in the Chief Signalling Office —B. 1871, State of Iowa. Started business as railway telegraphist and graduated at West Point, 1896. As cavalry officer took part in the Spanish-American War, 1898. Signal officer during the Insurrection in the Philippine Islands. Transferred to the Signal Corps of the U.S. Army, 1901. Since identified with the electrical, cable and radio work, U.S. Army. For a number of years in charge of the Electrical Laboratory of the Signal Corps in Washington, where radio equipment of the U.S. Army is designed and tested. In charge of the radio work of the U.S. Army on the Panama Canal. Represented the United States at the International Radiotelegraphic Conference of London, 1912. Member of the Inter-Departmental Board which prepared regulations for the control of radiotelegraphy in the U.S.A. Address: Office of the Chief Signal Officer, Signal Corps, U.S.A., Washington, D.C.

Sankey, Captain M. P. H. Riall, C.B., C.B.E., R.E. (Ret.)—B. Nenagh, Ireland, 1853. Educ. Switzerland, Royal Military Academy, Woolwich, School of Military Engineering, Chatham. Served in England, at Gibraltar, and as Instructor in Fortification at the Royal Military College, Kingston, Canada. Posted to the British Ordnance Survey, and had charge of the Trigonometrical Division, the Electrotyping Department and the Workshops. Retired from the service (1889) to join the Board of Messrs. Willans and Robinson, Ltd., and (1904) took up consulting work. Shortly afterwards joined the Boards of the Marconi's Wireless Telegraph Company, Limited, and of the Marconi International Marine Communication Company, Limited. Also a Director of several other companies. An accepted authority on thermodynamic problems. Member of the following institutions: Civil Engineers, Mechanical Engineers (President 1920), American Mechanical Engineers, Electrical Engineers, Iron and Steel, Naval Architects Junior Engineers, and Gas Engineers. Member of the Governing Board of the National Physical Laboratory and of the Wireless Telegraphy and Gaseous Explosives Committees of the British Association. Served during war as Hon. Engineering Advisor to the Director of Fortifications and Works. Served on the Hon. Valuation Advisory Committee of

Experts, dealing with the plant and buildings installed by manufacturing firms for munition purposes. Address: 57, Castle Bar Road, Ealing, W.5.

Sarnoff, David—B. in Russia, February, 1891. Entered the United States July, 1900. Started business 1906, and in 1907 received an appointment as Wireless Operator at the Marconi Station located at Siasconset, Nantucket Island, Mass. Served at various ship and Shore Stations, and eventually became Manager at the Marconi Station at Sea Gate. Has held a number of responsible positions in the service of the Marconi Wireless Telegraph Company of America, being now Commercial Manager of the Radio Corporation of America. Vice-President and Director of the Pan-American Wireless Telegraph and Telephone Company. Secretary of the Institute of Radio Engineers for 1915-1916-1917. Author of a paper on Radio Traffic read before the Institute of Radio Engineers, and a number of other papers on wireless telegraphy. Addresses: 90, Pinchurst Avenue, and 233, Broadway, New York.

Sayeki, Mitsuru, Chief Radio Engineer Installation and Inspection Section of the Direction General of Posts and Telegraphs since 1908.—B. Japan, 1871. Entered Naval College, 1889. Entered the Electric Technical Laboratory, in the Ministry of Communications, 1895, and has been engaged in the investigation of radiotelegraphy since 1899. The greater part of the "Teishinsho" Radio System was invented and designed by him. All the Government and private commercial coast stations were designed and erected by him. Nearly all the commercial ship stations in Japan are using the apparatus designed by him. Received prizes and medals for his investigations in radiotelegraphy.

Schledermann, Helmuth Joh. Christian, Electrical Engineer in Chief to the Royal Danish Navy. Knight Dannebrog.—B. Copenhagen, September 24th, 1876. Educ. Royal Naval Engineering College; Polytechnic Academy of Copenhagen. Further training with electrical firms in foreign countries. Controls the Electrical and Wireless services of the Danish Navy, also Inspector of Danish W/T stations and Electrical and W/T adviser to the Danish Lighthouse Department. Member of the Danish Engineers' Assn., the International Electro-Technical Commission and a Commission dealing with erection of a high-power wireless station in Denmark. Publication: A manual on W/T for the Danish Royal Navy. Address: Taffelbays Alle 11, Hellerup, Denmark.

Schwill, Fr., Sub-Director of the International Bureau of the Telegraphic Union at Berne.—B. Strasburg (in Alsace), April 21st, 1875. Started career as Member of the German Post and Telegraph Service. Took part in the International Radiotelegraphic Conference at Berlin in 1906, at the close of which he was appointed by the Swiss Federal Government to the International Bureau of the Telegraphic Union to organise and supervise the new Radiotelegraphic Section established by the Berlin Conference. Address: Bureau International de L'Union Télégraphique, Berne.

Shaughnessy, Edward H., O.B.E., M.I.E.E., M.I.Radio.E.—B. 1871. Engineer in charge wireless section, Engineering Department, British Post Office. Entered Post Office Engineering Department, 1896, served in experimental, testing, telegraph, and cable sections, specialising on underground and submarine cables. Served as a cable engineer (1895) on s.s. "Faraday," during the laying of a submarine cable in Gulf of Mexico, and the repair

of other cables. After five years in the provinces on construction and maintenance work returned to London (1913) to take up present position. For many years lectured on telegraphy, telephony, etc., at various London Technical Institutes. Member of the Radio Research Board. Post Office representative on Committee of Wireless Section, Institution of Electrical Engineers. Vice-President, Wireless Society of London. Examiner in Telegraphy for the City and Guilds of London Institute. Member of some committees and panels of the British Engineering Standards Association. Address: Engineering Department, General Post Office, London.

Simpson, Lt.-Col. Adrian F.H.S., C.M.G., A.M.I.E.E. (late) **R.E.**—B. Edinburgh, 1880. Educ. in his native city, and at Clifton and the Royal Military College, Sandhurst. Commissioned in His Majesty's Forces, 1900. Served in India, being transferred to the Regular Indian Army. Visited Russia 1903-5 for linguistic study. Becoming interested in wireless telegraphy, left the Army and started work with the English De Forest Wireless Telegraph Syndicate. His connection with Marconi's Wireless Telegraph Company commenced with his joining the Field Station Department. On the formation of the Russian Company of Wireless Telegraphs and Telephones, 1908, appointed managing director of that company. Member of the Anglo-Russian Chamber of Commerce. During the war served in Russia and at the War Office. Late Director of Wireless Telegraphy under the Government of India. Chevalier of Order of St. Anne, 3rd Degree, and of Order of S. Stanislas, 2nd Degree, with Crossed Swords. Director and Joint General Manager Marconi Wireless and International Companies.

Sins, Ernest.—B. 1859, Besançon, Alsace, where he received his early education. Joined the Ecole Polytechnique, and began his career by enrolling in the Corps of Telegraph Engineers. Participated in the organisation of the telegraphic and telephonic systems in Tunisia. Received an appointment in the Central Office of Posts and Telegraphs, Paris, 1892, where he ultimately rose to the position of Telegraph Engineer-in-Chief. Chief of the Correspondence Department of International Telegraphy, 1899, and took special interest in wireless telegraphy. Represented his country at the International Conferences on Radiotelegraphy held at Berlin, 1903, and acted as Secretary to the Commission appointed by the latter Conference for drawing up regulations. Sub-Director of the French Telegraphic Department, 1911, but resigned from the public service in the same year in order to be at liberty to take part in the development of wireless industry. One of the founders and directors of the Compagnie Générale Radiotélégraphique, and was afterwards managing director to the Compagnie Universelle de Télégraphie et de Téléphonie sans Fil. Since the beginning of 1918, general manager of the Compagnie Générale de Télégraphie sans Fil.

Slee, Commander J. A., C.B.E., R.N. (Ret.)—B. May, 1878, Wimbledon. Educ. on training ship "Britannia." First appointment as midshipman was to H.M.S. "Centurion," on which vessel he sailed for China, 1894, being transferred, three years later, to the brig "Nautilus" for sailing experience. Passed for his lieutenant's commission, obtaining four firsts out of a possible five. After service on the "Decoy," "Ernest," "Anson," and "Severn," qualified as Torpedo Lieutenant, and spent a year on the staff of the "Defiance" at Devonport, where he gained his first wireless experience,

1901. Whilst attached to H.M.S. "Queen," 1906, eyesight trouble developed and he was obliged to transfer to shore service. For two years after quitting the sea he served as one of the Wireless Telegraph Experimental Officers on the "Vernon" at Portsmouth, and from 1908 until last year was in charge of all shore wireless and war signal stations in Great Britain. Promoted Acting Commander, 1913. Acting Captain, 1918. On the formation of the Wireless Board, Captain Slee was appointed its chief. Awarded an O.B.E., January, 1919, C.B.E., April, 1919. Retired from the Navy due to the eyesight trouble mentioned above, December 1st, 1919, with the rank of Commander. Joined the Marconi International Marine Communication Co. as Technical Superintendent and Adviser, January, 1st, 1920. Address: 7, Elvaston Place, London.

Smith-Rose, Reginald Leslie, B.Sc., D.I.C., A.R.C.S.—Educ. Imperial College of Science and Technology: (a) Royal College of Science, 1912-14; (b) City and Guilds (Engineering) College, 1914-15. Diplomas: Bachelor of Science, London, First-class Honours; Royal Scholar, Physics, First Place; Associate of Royal College of Science (A.R.C.S.), Class 1, Physics Prizeman. Diplômé of the Imperial College (D.I.C.) for Research Work in Wireless Telegraphy at the City and Guilds (Engineering) College. Practical experience with Messrs. Siemens Bros., Woolwich, from 1915-19; engaged on experimental work in connection with Military, Manual and Automatic Telephones; and latterly with Thermionic Valve Amplifiers for Telephone Lines and Wireless Receiving sets. Now an assistant at the National Physical Laboratory, engaged on research on Thermionic Vacuum Tubes and general wireless work. Member of Sub-Committee "D" on Thermionic Valves, of the Radio Research Board of the Department of Scientific and Industrial Research. Senior Lecturer in Wireless Telegraphy and Telephony at the Polytechnic, Regent Street, W. Past Chairman and Hon. Secretary respectively of the Students' Section of the Institution of Electrical Engineers. Author of various scientific papers. Address: National Physical Laboratory, Teddington.

Snell, Sir John Francis Cleverton, Kt. (Cr. 1914), **M.Inst.C.E.**—Chairman, Water-Power Resources Committee of the Board of Trade, and member of the Imperial Wireless Telegraphy Committee. Past President of the Institution of Electrical Engineers, Fellow of the American Institute of Electrical Engineers, and a member of many other scientific societies. Until recently partner of Preece, Cardew, Snell and Rider, Consulting Engineers. Now Chief Electricity Commissioner under the "Electricity (Supply) Act, 1919." B. at Saltash, Cornwall, December 15th, 1869. Educ. Plymouth Grammar School and King's College, London. After service (1883) with Woodhouse and Rawson, and (1889) with Crompton & Co., appointed resident Engineer for the late General Webber, C.B., R.E., at South Kensington, and subsequently became the General's Chief Assistant. Appointed Borough Electrical and Tramways Engineer, Sunderland, August, 1896. In 1906 started practice as Consulting Engineer, Westminster, first with Mr. S. S. Moore & Co. and afterwards amalgamating with Preece, Cardew, Snell and Rider in 1910. Acted as principal technical witness for the Crown in the arbitration proceedings of the National Telephone Company, 1912. In 1917 appointed Member of the Electric Power Supply Committee of the Board of Trade, and in 1919 Chief Electricity Commissioner

(Designate), in which capacity he undertook the piloting of the "Electricity (Supply) Bill" through both Houses of Parliament. To fill this capacity he resigned his consulting practice and position in his late firm. Address: Wey Barton, Blyfleet, Surrey.

Solari, Marquis Luigi.—Cavaliere Ufficiale della Corona d'Italia, Cavaliere dei SS. Maurizio e Lazzaro, Commendatore di Danilo, and Cavaliere of St. Anna. Received decorations of bronze medals for the campaigns of China and Africa. —B. in Turin. Was appointed officer of the Italian Royal Navy in 1890. Obtained the diploma of Electrical Engineer at the University of Turin in 1898. In 1900 placed in charge of the Laboratory of Wireless Telegraphy at the Royal Dockyard of Spezia. In 1902 took charge of the wireless telegraph station on the Italian warship "Carlo Alberto" during the historic experiments on that vessel conducted by Senatore Marconi. In 1903 delegate of the Italian Government to the Berlin Wireless Conference. In 1904-05 supervised the Wireless Telegraph Department of the Italian Ministry of Posts and Telegraphs. Official delegate of the Italian Government at the International Congress of Electricity held at St. Louis, U.S.A., in 1904. Joint inventor with Professor Lori, of the Padua University, of a magnetic relay. Has published several papers on wireless telegraphy in various periodicals and reviews. Since 1906 has devoted himself to the development of the Marconi system in Italy. Address: Via Maria Adelaide, 8, Rome (Italy).

Squier, Major-General Sir George Owen, K.C.M.G., Ph.D.—Chief Signal Officer U.S. Army. Formerly military attaché to the American Embassy in London. Educ. Johns Hopkins University, Baltimore. Grad. Doctor of Physics 1893. Research student under the late Professor Rowland and in the laboratory of the late Sir William Preece at the British General Post Office. Discovered the use of living trees as a means of receiving wireless messages 1904, and published a paper entitled "The Absorption of Electro-Magnetic Waves by Living Vegetable Organisms." On June 28th, 1911, an important treatise by him, dealing with multiplex telephony and telegraphy by means of waves guided by wires, was read before the American Institute of Electrical Engineers. Author of numerous papers on the subject of wireless telegraphy and has devoted special attention to the use of wireless telegraphy in military operations. Awarded the Elliott Cresson Gold Medal for his researches in multiplex telephony, 1912. Presented a paper on "Cable Telegraphy" to the Physical Society of London, June, 1915, advocating the adaptation of Wireless Engineering methods to ocean cables. Author of "Tree Telephony and Telegraphy." Member of National Academy of Sciences, 1919. Awarded the Franklin Medal, by the Franklin Institute of Philadelphia, Pa., 1919. Awarded the Distinguished Service Medal, United States Army, 1919. Address: War Department, Washington, D.C., U.S.A.

Stanley, Rupert, Principal Municipal Technical Institute, Belfast. Chevalier of the Legion of Honour.—B. in Ireland, 1876. Educ. Irish schools and universities. Joined technical staff of the Isle of Thanet Electrical Light and Power Company in 1899, and two years later appointed Lecturer in Physics and Electrical Engineering at the Brighton School of Science and Technology. Returned to Belfast in 1903 as Professor of Physics and Electricity at Belfast Municipal Institute. Member of the Institution of Electrical Engineers. In 1914 undertook the pre-

paration of a "Textbook of Wireless Telegraphy," which has become a standard textbook on the subject, both at home and in America, and is now published in two volumes, of which the second deals exclusively with valves and valve apparatus. Started war service as second in command of a Field Company in the Ulster Division, but was soon transferred to radio-telegraph work, and served in France from October, 1915, to April, 1918, where he became Chief Wireless Instructor to the B.E.F. Address: Municipal Technical Institute, Belfast.

Stone Stone, John.—Studied electricity, chemistry, physics and mathematics at Columbia University and Johns Hopkins University. Experimentalist in research laboratory, American Bell Telephone Company, 1890-99. Made some investigations in telephony without wires, 1892. Consulting Electrical Engineer and expert for the Ladd Wireless Telephone Syndicate, experimenting on directional signalling, 1899. Retained in 1900 by the Stone Wireless Telephone Syndicate, and in 1902 when the Stone Telegraph and Telephone Company was organised. Author of many scientific papers on wireless. Granted more than 100 U.S. patents in the radio field and a correspondingly large number of foreign patents. Fellow, American Academy of Arts and Sciences. Fellow, American Association of Advanced Science. Fellow and Past-President Institute of Radio Engineers. Member or Associate of the following societies: American Institute of Electrical Engineers. American Electro-Chemical Society, U.S. Navy Institute, Franklin Institute, Mathematics and Physics Club, Boston Scientific Society. His investigations have been principally directed along the lines of eliminating interference in wireless telegraphy.

Swinburne, James, F.R.S.—B. Inverness, February 28th, 1858. Educ. Clifton College. Employed by Messrs. J. W. Swan and Co. (1881) to organise their lamp factory in Paris; later he went on a similar mission to America. Consulting Engineer since 1894, and has attained considerable eminence in various branches of science. As an expert on wireless telegraphy his fame has been recognised by the Government. Member of the Technical Committees considering the Imperial Wireless Scheme, 1912 and 1919-20. Member of various scientific societies, and is on the Council of some. President of the Institution of Electrical Engineers, 1902-3. Addresses: 82, Victoria Street, S.W.1.; Woodhurst, Oxted, Surrey.

Swinton, Alan A. Campbell, F.R.S., M.Inst.C.E., M.I.E.E., M.I.M.E., President of the Wireless Society of London.—B. Scotland, 1863. Opened career in 1882 at the Armstrong Works, Elswick. Consulting electrical engineer in London since 1887, having been responsible for the carrying out of many large electrical installations. Chairman of Crompton & Co., Ltd., and director of several electricity supply and engineering manufacturing companies. Associated with the development of the Parsons turbine and other important inventions. Chairman of the Council of the Royal Society of Arts; Chairman of the British Scientific Instruments Research Association; a Member of the Executive Committee of the Board of the National Physical Laboratory; Past President of the Röntgen Society. Member of the Executive Committee of British Science Guild; a Manager of the R. Institution of Great Britain (1912-15). Member of Sub-committee "B" on Atmospherics of Radio Research Board of the Department of Scientific and Industrial Research. Has devoted considerable attention to scientific research, including

wireless telegraphy. Address: 66, Victoria Street, Westminster, S.W.1.

Talor, D. Jose, Col., Spanish Royal Engineers, Director of the Centro Electrotécnico y de Comunicaciones, Madrid. Has the full control of the Wireless Services in the Spanish Army. A member of the Spanish permanent Radiotelegraph Commission. One of the chief contributors of military as well as civil wireless in Spain.

Tesla, Nikola.—B. Smilian, Sika, Dalmatia, 1857. One of the foremost of the world's electricians. Quite early in life he began to take delight in arithmetic and physics. Graduated Carlstadt, 1873. Devoted his energy to electrical studies and investigations. Went to Graz, where, at the Polytechnic School, he prepared for work as professor in mathematics and physics. Whilst there he was so struck with the objections to the use of commutators and brushes that he made up his mind to remedy that defect in dynamo electric machines. Visited America about 1882, where he captured the attention of the whole world with his fascinating experiments on high-frequency electric currents. Since 1890 devoted himself almost entirely to studies of alternating currents of high frequency and very high potentials.

Thornblad, Thor, Lieut., R. Swedish Engineers.—B. Upsala, Sweden, June 10th, 1885. Pioneer of Wireless Telegraphy in Sweden. His interest in the theory and practice of wireless dates from 1899. Author of the first great Swedish standard work on Wireless Telegraphy, "Trådlösa Telegrafer," published 1911. Passed his examination as student at the High School of Stockholm, 1904. Entered the Royal Engineers as Cadet, 1904. Commissioned 1906. Studied mathematics, physics and chemistry 1906-10, first at the Technological Academy of Stockholm, later at the University of Stockholm. By command of the Swedish Government studied Wireless Telegraphy in foreign countries. Devoted considerable attention to the use of wireless on aircraft. Author of a number of articles on radiotelegraphy in the scientific and daily press. Knight of the Order of the Crown of Italy. Address: Stråndvägen 7, Stockholm.

Todd, David Wooster, Captain, U.S. Navy, At present in command of the Flagship "Pittsburgh" in European waters.—B. Round Valley, California, June 29th 1874. Educ. private and public schools in Mich., Nev., and San Francisco. Appointed to Naval Academy, 1891, graduated in June, 1895. Has served at sea on the following vessels of the United States Navy: "Constellation," "Monongahela," "Olympia," "Oregon," "Wheeling," "Rainbow," "Chicago," "Iowa," "Newark," "Denver," "Monterey," "Concord," "Galveston," "Wyoming," "Dixie"; has served ashore as instructor in ordnance, Naval Academy; in charge of Radio Division of Bureau of Steam Engineering, Navy Department, and as Assistant Superintendent of the Radio Service. Attended International Radio-Telegraphic Conference, London, 1912, as a delegate. Director Naval Communications, August 3rd, 1916, succeeding Capt. (now Rear-Admiral) W. H. G. Bullard, U.S. Navy. Attended Inter-Allied Radio Conference in Paris upon United States entry into European War, and subsequently organised the American end of the Inter-Allied Transatlantic Radio System. Also organised and directed the United States Cable Censorship, and served on the Censorship Board as Chief

Cable Censor. Address: U.S.S. Pittsburgh, c.o. Postmaster, New York.

Torikata, Dr. Wichi.—B. Japan, 1883. Trained to the profession of Electrical Engineering in the Engineering College of Tokyo Imperial University. Graduated 1906. Devoted himself to the close study of Radiotelegraphy and Telephony, acting at one time as Assistant Engineer to Dr. Osuke Asano, ex-Director of the Electro-Technical Laboratory, and also as Chief Engineer of the wireless section. Inventor and patentee of the Koseki or Mineral Detectors, the T.Y.K. Oscillation Gap for use in Radiotelephony, and the Wave Telephony superposed on electric power transmission line. The late Mikado of Japan recognised his services by awarding him the Fifth Degree of Decoration, bestowing this honour specifically for his services in connection with Wireless Detectors, whilst the Ruling Emperor has presented him with the Fourth Degree of Decoration on account of his Radio Researches. The Senate of Tokyo University marked their appreciation of his efforts by bestowing upon him in 1915 the title of "Dr. Engineer." Has received many prizes for technical work, including the First Medal of the Japanese Electric Engineers' Society (established 1888), and Academy Prize and Medal granted by the Japanese Imperial Academy. He took his position after the resignation of Dr. M. Torigawa, ex-Director. Address: No. 2801 Sanno, Omori, near Tokyo.

Travailleur, Maurice.—B. Brussels, 1871. Graduated as engineer at Brussels University, 1893. Appointed Electrical Engineer to the late King of the Belgians, 1897. One of the founders of Internationale Société Anonyme, the Marconi International Marine Communication Co., Ltd., and Managing Director of the Télégraphie sans Fil.

Tsiang Tseng-yi.—Native of the Haining District of the Chekiang Province. Acquired the third degree of Literature at the Metropolitan Examination in Peking, 1904, and appointed Junior Clerk of the Board of Revenues. Soon afterwards transferred in the same rank to the Board of Communications (then known as Yuchuanpu) by its special recommendation for dealing with telegraph matters. Chinese telegraphs were then administered partly by a commercial company and partly by the provincial viceroys and governors. Mr. Tsiang proposed that all the commercially and provincially owned telegraph lines be nationalised and placed under the direct control of the Yuchuanpu. This proposal received the approval of the Government, and was put into operation. In 1911, as Commissioner of Telegraphs of the Yuchuanpu, he caused two powerful radio stations to be established, one in Peking and the other at Nankin. Since their establishment the wireless service has been greatly improved and extended to such localities as Shanghai, Woosung, Foochow, and Canton, along the coasts, and Kalgan and Wuchang in the interior. Both the Ministries of War and Navy have followed in the steps of the Ministry of Communications by installing radio stations for their respective purposes. Mr. Tsiang served over ten years in the telegraph service, holding the following important positions: 1910-11, Commissioner of Telegraphs of the Yuchuanpu; 1913-16, Chief of the Financial Department of Telegraphs, Posts and Navigation. Acted as Chief of the Telegraph Department and Director-General of Telegraphs of the Ministry of Communications, and Chairman of the Chinese Society of Electrical Science.

Turner, Laurence Beddome, M.A., M.I.E.E.—B. 1886. Educ. Bedford Grammar School and King's College, Cambridge (1904). First-class honours in Mechanical Sciences Tripos in 1907. Spent 1907-08 in research work at the C.U. Engineering Laboratory, receiving in 1908 the award of the University "John Winbolt Prize" for an essay on this research. After a year in the workshops and drawing office of Messrs. Siemens Bros. at Woolwich and Siemens u. Halske A.G. at Berlin, entered in 1910 the Engineer-in-Chief's office of the G.P.O. Engaged there in W/T experimental work, and in the design and installation of new ship-and-shore stations. Attached to the Army Signals Experimental Establishment at Woolwich 1916, where he designed wireless field apparatus, including the Infantry "Loop Set." Fellow and Lecturer of King's College, Cambridge, 1919. Member of the Imperial Wireless Telegraphy Committee, 1919. Address: King's College, Cambridge.

Turner, Samuel, A.M.I.E.E., A.F.A.C.S., A.F.Aer.S., M.I.Radio.E.—Educ. Barrow-in-Furness Sec. and Tech. Coll., under G. Grace, D.Sc., etc. Two years' works training at Messrs. Vickers, Maxim, Barrow. Appointed to post in Telephone Research Labs., London. Subjects included Telephony and Telegraphy, Valves and Valve Circuits, Telephone Transmission, High-Frequency Measurements, Automatic Telephony, etc. Lecturer and Instructor to R.F.C. W/T Officers at Brooklands (under Major Prince) in W/Telegraphy and Telephony applied to Aircraft December, 1915—Oct., 1917. Research work in W/Telephony, C.W., etc. (using Triode valves) at R.F.C. W/T Exper. Station, Biggin Hill and Woolwich (1917-18). Transferred to Air Ministry to develop and supervise Technical Section. Resumed civilian research work July, 1919. Inventions: Devices for W/Target Training of Pilots, Observers, etc. Publications: Papers (London Telephone Society). Articles: "Electrician" (and other papers), and I.C.S.; Textbook on Automatic Telephony, etc. Address: 31, Belsize Square, N.W.3.

Turpain, Professor Albert.—B. La Rochelle, December 2nd, 1867. Employed in the Department of Posts and Telegraphs of France, 1884-87. Licentiate in physical science, 1888. Licentiate in mathematics, 1891. Obtained doctorate of science, 1889. As tutor of physics at the Faculty of Science, Bordeaux, succeeded in sending messages without wires from an equipment erected in the college buildings. Has experimented in wireless telegraphy with successful results since 1894. Applied himself to the question of tuning and (1899) experimented with a means for determining the direction of electromagnetic waves. Resumed these experiments 1912. Succeeded in obtaining graphic records of time signals by means of a micro-ammeter over a distance of 300 km. between Poitiers and Paris, 1911. Carried out successful experiments in photographically recording wireless telegraph signals which passed between Paris and Poitiers.

Vallauri, Giancarlo.—B. Rome, 1882. Educ. in the classical schools of Italy. Entered the Royal Naval Academy. Appointed officer of the Royal Italian Navy, 1903. After a few years at sea he quitted the active naval service and joined the Polytechnic School in Naples, obtaining the diploma of engineer and the electro-technic diploma, 1907. Since conducted electrical tuition in the Polytechnic Schools of Padua, Karlsruhe and Naples. Connected with many industrial electric establishments and placed his services at the disposal of the Royal Navy

for the installation of wireless stations. inaugurated at the Polytechnic School in Naples a course in Wireless Telegraphy 1912, and supervised that subject till the end of 1916, when he was called to the direction of the Institute of Electricity and Wireless Telegraphy of the Royal Navy by the Royal Naval Academy in Leghorn. His attention has mainly been turned to the study of ferro-magnetic phenomena, to which he has made important contributions. Has published a series of papers on Ionic Valves, which has won wide publicity and appreciation. Address: R. Accademia Navale, Leghorn, Italy.

Van der Bijl, Dr. H. J.—Scientific and Technical Adviser Bureau of Mines and Industries, Union of South Africa. Educ. Victoria College, British South Africa, and University of Leipzig, where he gained his doctorate. Visited United States, 1912, and joined Engineering Department, Western Electric Company. Instrumental in devising several improvements in Telephone and Telegraph instruments. Figured prominently in the development of the Vacuum Tube and ranks among the leading authorities on thermionics. Address: Scientific and Technical Adviser, Bureau of Mines and Industries, Pretoria, S.A.

Van der Pol, Balth, Jun., Director of Physical Research Laboratory, Teyler's Institute (Haarlem).—B. January 27th, 1889, at Utrecht (Holland). Educ. at Utrecht, graduating as *Candidaat* in the University (1914), and as *Doctorandus* (1916). Studied Experimental and Theoretical Physics, under Professors Julius and Ornstein. His interest in the theory and practice of wireless dates from 1904. Came to England in 1916 to study under Professor J. A. Fleming. Proceeded to Cambridge in 1917, working under Professor Sir J. J. Thompson, at the Cavendish Laboratory for about eighteen months. He is author of a number of valuable monographs upon physical and radiotelegraphic subjects. Appointed Conservator and placed in charge of the physical research laboratory of Teyler's Institute, Haarlem (Holland). He is now engaged on research work there with Professor H. A. Lorentz. Address: Physical Laboratory, Teyler's Institute, Haarlem, Holland.

Vanni, Dr. Giuseppe.—B. Albano Laziale (Rome) in 1862. Graduated in science 1887. Went to Strassburg 1890, where, under Professor Kohlrausch, of the Physical Institute, he studied electrical measurements. Appointed to teach physics at the Collegio Romano, Rome, 1894. Nominated professor and director of the physical laboratory of the Military Radiotelegraphic Institute in Rome, 1912. Took part in the International Radiotelegraphic Conference of London, 1912, as a member of the Italian delegation, and also at the Conferences held in Paris in 1912 and 1913. His works are principally concerned with electrolgy, electrical engineering, and electrical waves. By means of an hydraulic microphone of his invention made interesting experiments in wireless telephony between Rome and Tripoli (1,000 km.) and between Rome and Treviso (420 km.), and in 1914 his paper on the "Progress and Actual State of Wireless Telegraphy and Telephony" gained the Cagnola Prize of the Royal Lombard Institute of Science and Literature in Milan. Address: Rome, Military Radiotelegraphic Institute, Viale Mazzini 10.

Vvyan, R. N.—Educ. at Charterhouse. Received electrical and engineering training Faraday House. Joined Marconi's Wireless Telegraphy Co., 1900. Built Poldhu Wireless Station, subsequently proceeding to Canada as

Managing Engineer until 1908. In the course of his work visited most European countries and also South Africa and America. Responsible for design and construction of most of the high-power stations erected by the Marconi Company, including naval strategic stations and others erected for the Admiralty early in the late war. Joined R.F.C., 1916, and served in France. Later sent to America as member of the British War Mission. Demobilised early 1919, since when Superintending Engineer of the Marconi Company. In charge of the design, construction and management of all fixed wireless stations owned or erected by that company.

Wade, C. F. Newton, A.M.I.Rad.E., Postmaster-General and Superintendent of Land and Radio Telegraphs, British North Borneo.—B. Shepton Mallet, Somerset. Five years with Messrs. Siemens Bros. & Co., at Woolwich, as Radio Engineer, during which time he was employed on extensive experiments on earth telegraphy, earthed and buried aerials and transmission of high-frequency currents along wires, in addition to ordinary experimental, designing and testing work in connection with Radio apparatus. Superintendent of Government Radiotelegraphs, British North Borneo, 1918. Postmaster-General and Superintendent of Land Telegraphs in addition in January, 1920. Address: Jesselton, British North Borneo, and Intake, Sheffield, Yorks.

Walter, L. H., M.A., A.M.I.E.E.—B. London, 1870. Educ. private schools in England, at Hanover, Germany, Trinity College, Cambridge (1894-98), where he took honours in Natural Sciences. Later carried out research work in the University Engineering Laboratory. Experimental assistant to Sir Hiram S. Maxim. Editor of "Science Abstracts," 1903, when that publication was taken over by the Institution of Electrical Engineers, which position he still holds. Inventor of several forms of detectors of electrical oscillations, and for his magnetic type of oscillation galvanometer was awarded the John Scott Medal. In 1905 he drew attention to the advantages of directive wireless telegraphy and, associating himself with Captain Tosi and Dr. Bellini, he introduced the directive system and the wireless compass into England. Address: Institution of Electrical Engineers, 1, Albemarle Street, W.1, and 23, Park Mansions, Battersea Park, S.W.11.

Weagant, Roy A.—B. Morrisburg, Ontario, Canada, 1881. Educ. Stanstead College, Stanstead, Quebec, Canada, and McGill University, Montreal, Canada. Graduated from Electrical Engineering Course, 1905. Studied Physics under Sir Ernest Rutherford and first became interested in wireless through witnessing some of his experiments in Hertzian waves. Gained engineering experience with the Montreal Light, Heat, and Power Company, the Westinghouse Electric Manufacturing Company of Pittsburgh, Pa., and the De LaVal Steam Turbine Company. Took up commercial wireless work in 1908. Entered service of the Marconi Wireless Telegraph Company of America, 1912, where he soon rose to the position of Chief Engineer. Appointed, 1920, Consulting Engineer, Radio Corporation of America. Fellow of the Institute of Radio Engineers and former member of its Board of Directors and Standardisation Committee. Inventor of a novel method of eliminating static interference. Awarded Liebmann Memorial Prize for 1920. Address: Douglas Manor, Long Island, New York.

Whiddington, Richard, M.A., D.Sc., Professor of Physics, University of Leeds.—B. November

25th, 1885, in London. Educ. at St. John's College, Cambridge, where after taking degree in 1908 he undertook research work under Professor Sir J. J. Thomson at the Cavendish Laboratory. Elected Fellow of St. John's College, 1911. In September, 1914, went to Royal Aircraft Factory, Farnborough, to design aircraft wireless apparatus for the Flying Corps. Received first commission in Army in 1915, leaving Farnborough soon after. During the war designed a number of the standard R.A.F. wireless sets and assisted on the W.T. Board and Inter-Allied W.T. Commission in Paris. Demobilised with rank of major, June, 1919. Has published a number of original papers on various electrical subjects. Member of Subcommittee "D" on Thermionic Valves, of Radio Research Board, of the Department of Scientific and Industrial Research. Address: Leeds University.

Whitmore, G. Scovell.—B. Dawlish, 1881. Educ. St. Andrew's College, Dublin. Served under Eastern Telegraph Company, Ltd., at Porthcurnow and Malta cable stations. Entered Heaton works of Sir C. A. Parsons & Co., 1902, and became Chief Assistant to the Engr. and Gen. Manager of Northern Counties Electricity Supply Co., Ltd., in 1906. Joined the engineering staff of Marconi's Wireless Telegraph Co., Ltd. (1909), and appointed (1910) Managing Engr. at the Transatlantic W.T. Station, Glace Bay, Canada. Since 1912 employed at the head office of Marconi's Wireless Telegraph Co., Ltd., mainly in connection with the construction and maintenance of high-power W.T. stations, occupying the position of Act. Suptdng. Engr. August, 1916—March, 1919, during absence of the Suptdng. Engr. on military service.

Wibier, Major Albert.—B. Renaix, East Flanders, June 3rd, 1876. Early turned his attention to wireless. Installed and organised network of wireless communication in Belgian Congo. Now Director-General, Congolese Wireless Service at Brussels. Address: 2, rue de l'Esplanade, Brussels, Belgium.

Wien, Professor Max.—B. Königsberg, 1866. Made a special study of the subject of physics under Helmholtz and others, and assisted Röntgen, 1891-93. Devoted considerable attention to the study of electro-magnetic waves and their propagation, and was the originator of the quenched spark.

Wilson, Brig.-Gen. Samuel Herbert, C.B. (1918), **C.M.G.** (1914); Officier Legion d'Honneur; French Croix de Guerre; Commandeur de la Couronne, Belgium; Belgian Croix de Guerre.—B. 1873. Entered Army, R.E., 1893. Captain 1904, Major 1913, Bt. Lt.-Col. 1916. Bt. Col. 1917. Served S. Africa, 1899-1900 (Queens' Medal with two clasps). Served great war, 1914-18; General Staff Officer, 2nd Grade, 1911-15; General Staff Officer, 1st Grade, 1915-16; Brig.-Gen. General Staff, 1916. Principal Assistant Secretary, Committee of Imperial Defence and Head of Imperial External and Defence Branch Cabinet Secretariat. Secretary Imperial Communications Committee; Wireless Telegraphy Committee; Overseas Defence Committee; Home Ports Defence Committee. Address: 22, Stanford Road, Kensington, W.8. (Tel. 5049 Western); and Heath Cottage, Puttenham, Surrey.

Yagi, Professor Hideo., Professor of Electrical Engineering at the Tohoku Imperial University and member of the Institute of Radio Engineers.—B. Osaka, January, 1886. Graduated from the Tokyo Imperial University, 1909. Lecturer and later Professor of Electrical Engineering

at the Sendai Higher School. Studied in Dresden, London, and Harvard, 1913-16, engaging at the same time in several researches on radic frequency phenomena. Author of many scientific papers.

Yokoyama, Eitaro, Director of Electro-Technical Laboratory in Japanese Department of Communications.—B. 1883. Graduated Engineering College of the Tokyo Imperial University, 1908. Radio Engineer to Ministry of Communications, Japan. Engages in radio researches at the Electro-Technical Laboratory of the Ministry. One of the inventors of T.Y.K. Oscillation Gaps of Radiotelephony. Awarded by the Ruling Emperor with the Fifth Degree of Decoration. Granted many prizes for his wireless investigations and inventions, including the Academy Prize and Medal of Japanese Imperial Academy. Proceeded to America and Europe to study, 1916. Returned to Japan, 1918, and resumed service at the same Laboratory. Promoted to the Head of the Radio Section of the Laboratory, 1920. Holds additional posts as Engineer to the Formosan Government and Lecturer of the Tokyo Higher

Technical School. Private address : Kiharayama 1523, Omori, Tokyo.

Zenneck, Professor, Dr. J., Professor of Experimental Physics at Technical College, Munich.—B. April 15th, 1871, in Würtemberg. Studied for four years in a Theological College at Tübingen. Abandoning theology, studied mathematics and natural history, particularly zoology, 1889-94. Passed the State examination in these subjects, 1894. Obtained his doctorate, 1894. Studied natural history in London and elsewhere. Subsequently devoted himself entirely to physics. Assistant in the Physical Institute in Strassburg, 1895-99. Engaged in making tests with wireless telegraphy in the North Sea, 1899-1900. Lecturer, Assistant Professor of Physics in the Technical College, Dantzig, 1905 and 1911. Professor of Physics at the Technical College, Brunswick, 1906. Joined one of the largest chemical works in Germany, 1909. Professor of Physics at the Institute of Technology, Munich, 1913. During part of the war Technical Adviser to the Atlantic Communication Co., which then operated Sayville wireless station. Address : Technische Hochschule, München, Germany.

OBITUARY.

SINCE we went to Press with our last edition, the world of wireless has had to mourn the loss of some prominent men.

* * * * *

We regret to have to record the death at Bologna, Italy, on June 8th, 1920, at the age of 70 years, of **PROFESSOR AUGUSTO RIGHI**. Born in the city in which he died, in 1850, he was educated at the University there. He was Professor of Physics at Bologna Technical Institute from 1873 to 1880, at Palermo University 1880-1885, at Padua University 1885-1889, and at Bologna University from 1890 until his death. From 1872 to 1918 he published 234 original papers in Scientific Periodicals, many of which have been translated into French, English, German and Russian. He is the author of several books which he published from time to time. Professor Righi represented the Italian Government as its Plenipotentiary at the International Time Congress of Paris, 1912-1913, and also at the International Congress of Radiotelegraphy and Electricity held in Brussels in 1910. His death leaves a wide gap in the ranks of Radio Scientists.

On December 5th, 1920, **MR. H. J. NIERSTRASZ**, Inspector of the Coast and Ship Wireless Telegraph Service of Holland, departed this life in his fifty-seventh year. Born April 11th, 1864, he was one of the pioneers of wireless telegraphy in Holland and for his services was created a Knight of the Oranje-Nassau Order. For several years he ably filled the important post of Chief of the Technical Wireless Staff of the Dutch Government. In his early years he conducted experiments between The Hague and Rotterdam (1900) and by the results obtained he was encouraged to continue his investigations. In his official capacity Mr. Nierstrasz was a delegate at the International Radio Telegraph Conferences of London and Berlin, and was also present at the Conference on the safety of Life at Sea held in London in 1914.

DR. ALEXANDER MUIRHEAD, F.R.S., who died at the Lodge, Shortlands, Kent, on December 13th, 1920, aged 72, was associated with Sir Oliver Lodge in the latter's pioneer work in connection with wireless telegraphy. Some two years before Marconi took out his patents, Sir Oliver lectured on Hertzian waves at the Royal Institution, and Dr. Muirhead, who was present, suggested to the lecturer that what he had said might be applied to the science of telegraphy. The result was their valuable collaboration.

LITERATURE OF WIRELESS TELEGRAPHY AND TELEPHONY

THE literature of radiotelegraphy and telephony increases year by year, and has now reached the stage when we consider that our readers will find it useful to have a record of the various items which have appeared during the past year, not merely in the shape of books, but also of periodical publications. The *résumé* which finds a place below covers only the more important of such items as deal directly with the subject of this volume; for works and papers on the more general subjects we must refer readers elsewhere.

(A) NEW BOOKS DEALING WITH WIRELESS PUBLISHED DURING 1920.

- La Télégraphie sans fil au Congo Belge.** R. B. Goldschmidt and R. Brailard. [Brussels: *M. Hayez*, Imprimeur de l'Académie Royale de Belgique. Pp. 120.]
- Selected Studies in Elementary Physics :** A Handbook for the Wireless Student and Amateur. E. Blake, A.M.I.E.E. [London: *The Wireless Press, Ltd.* Pp. viii+176. Price 5s. net.]
- Wireless Telegraphy.** W. H. Marchant. [London: *Sir Isaac Pitman & Sons, Ltd.* Second edition. Pp. ix+305. Price 7s. 6d. net.]
- La Telefonia senza Filo.** Umberto Bianchi. [Milan: *Ulrico Hoepli.* Pp. viii+296. Price L.10.]
- Radio Engineering Principles.** H. Lauer, B.S., and H. L. Brown, B.E.E. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.* Pp. xv+300. Price 21s. net.]
- Wireless Telegraphy and Telephony :** First Principles, Present Practice and Testing. H. M. Dowsett, M.I.E.E. [London: *The Wireless Press, Ltd.* Pp. xxxi+331. Price 9s. net.]
- Electric Oscillations and Electric Waves.** G. W. Pierce. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.* Pp. ix+517. Price 30s. net.]
- Grundriss der Funken-Telegraphie in Gemeinverständlicher Darstellung.** Dr. Franz Fuchs. [Munich: *R. Oldenbourg.* Eleventh edition. Pp. 73. Price 2.75M.]
- The How and Why of Radio Apparatus.** H. W. Secor. [New York: *Experimenter Publishing Co. Inc.* Pp. 160. Price \$1.75.]
- Etude de Quelques Problemes de Radiotélégraphie.** H. de Bellescize. [Paris: *Gauthier-Villars et Cie.* Pp. 174. Price 16 fr.]
- Eléments de Télégraphie sans fil pratique.** F. Duroquier. [Paris: *H. Dunod.* Second edition. Pp. 130. Price 7 fr.]
- Radiotélégraphie pratique et Radiotéléphonie.** P. Maurer. [Paris: *H. Dunod.* Pp. 386. Price 21 fr.]
- Introduction à la Théorie des Courants Téléphoniques et de la Radiotélégraphie.** J. B. Pomey. [Paris: *Gauthier-Villars et Cie.* Pp. xiv+510. Price 50 fr.]

- Elements of Radiotelegraphy.** E. W. Stone, M.Inst.R.E. [New York: *D. van Nostrand Co.* London: *Crosby, Lockwood & Son.* Pp. vii+267. Price 16s. 6d. net.]
- Vocabulaire en Cinq Langues.** H. Viard. [Paris: *Gauthier-Villars et Cie.* Pp. x+108. Price 15.00 fr.]
- The Consolidated Radio Call Book.** [New York: *The Consolidated Radio Call Book Co. Inc.* Second edition. Pp. 160. Price \$1.25.]
- Practical Amateur Wireless Stations.** J. A. White. [New York: *The Wireless Press Inc.* Pp. 133. Price 5s. net.]

NEW RADIO PERIODICALS STARTED DURING 1920.

- Radioélectricité.** [Paris: *Société de Publications Radio-techniques.*] Price 3 fr. Monthly.
- La T.S.F. Moderne.** [Paris: *La T.S.F. Moderne.*] Price 3.50 fr. Monthly.
- Tijdschrift van het Nederlandsch Radiogenootschap.** [Baarn, Holland: Published by the *Nederlandsch Radiogenootschap*, Oude Utrechtseweg. 8.]

(B) RÉSUMÉ OF ARTICLES PUBLISHED DURING 1920

A complete list of all articles dealing with wireless would occupy too much space in a volume of this character. A review of radio literature is now being issued monthly in the pages of *The Radio Review*, so that a complete list of such articles as are published month by month, with abstracts of their contents, is now available. The following list, therefore, merely contains references to the most important only of the technical articles that have appeared during the past year. These are roughly classified under separate headings, but it should be noted that in many cases articles may refer to more than one branch of the subject. This is particularly the case with articles dealing with valves, which have applications in almost every branch of radio work.

RADIO FREQUENCY MEASUREMENTS AND THEORY.

- Damped Oscillations in Coupled Circuits.** G. Bramwell Ehrenborg. [*Radio Review*, 1, pp. 220-224, February, 1920; pp. 329-336, April, 1920; and pp. 375-380, May, 1920.]
- The High-Frequency Resistance of Wires and Coils.** G. W. O. Howe. [*Journal of the Institution of Electrical Engineers*, 58, pp. 152-170, February, 1920.]
- The Mandelstam Method of Absolute Measurement of Frequency of Electrical Oscillations.** J. Tykocinski-Tykociner. [*Philosophical Magazine*, 39, pp. 289-294, March, 1920.]
- The Calculation of the Self-Inductance of Multi-Layer Coils.** A. Esau. [*Jahrbuch der Drahtlosen Telegraphie*, 15, pp. 2-26, January, 1920.]
- Measurement and Comparison of Signal Intensities in Wireless Receivers.** H. de Bellescize. [*Revue Générale de l'Électricité*, 7, pp. 325-328, March 7th, 1920.]
- Refraction of Electric Waves.** T. L. Eckersley. [*Radio Review*, 1, pp. 421-428, June, 1920.]
- Recording Oscillographs and Amplifiers of Extremely Low Frequency: their Application to the Recording of Radiotelegraphic Signals.** H. Abraham and E. Bloch. [*Revue Générale de l'Électricité*, 7, pp. 211-222; pp. 255-272, February 14th and 21st, 1920.]

- On the Period and Decrement of an Oscillatory Electrical Circuit provided with a Short-circuited Secondary.** I. Jones. [*Philosophical Magazine*, 39, pp. 553-565, May, 1920.]
- Measurement of Received Radio Currents with the Electrometer.** E. O. Hulbert and G. Breit. [*Physical Review*, 15, pp. 405-408, May, 1920.]
- Some Laboratory Uses for the Contact Rectifier.** J. C. Jensen. [*Physical Review*, 15, pp. 224-225, March, 1920.]
- An Undamped Wave Method of Determining Dielectric Constants of Liquids.** W. H. Hyslop and A. P. Carman. [*Physical Review*, 15, pp. 243-244, March, 1920.]
- Conductivity and Dielectric Co-efficient of Dielectrics at High Frequencies.** G. E. Bairsto. [*Proceedings of the Royal Society*, 96A, pp. 363-382, January 2nd, 1920.]
- The Behaviour of Hertzian Gratings.** R. Gans. [*Annalen der Physik*, 61, pp. 447-464, March 3rd, 1920.]
- On the Fundamental Formulations of Electrodynamics.** G. H. Liveness. [*Philosophical Transactions of the Royal Society*, 220A, pp. 207-245, March 17th, 1920.]
- The Scattering of Plane Electric Waves by Spheres.** T. J. I'a Bromwich. [*Philosophical Transactions of the Royal Society*, 220A, pp. 175-206, February 2nd, 1920.]
- The Diffraction of the Field by a Cylinder and its Effect on Directive Reception on Board a Ship.** Commandant René Mesny. [*Radio Review*, 1, pp. 532-540, August, 1920; and pp. 591-597, September, 1920.]
- The Efficiency of Aerials.** G. W. O. Howe. [*Radio Review*, 1, pp. 540-543, August, 1920.]
- A Beat Method of Testing the Sluggishness of Contact Detectors.** R. Ettenreich. [*Physikalische Zeitschrift*, 21, pp. 208-214, April 15th, 1920.]
- Standards of High Frequency.** A. Campbell, [*Electrician*, 84, p. 66, January 16th, 1920.]
- The Electromagnetic Plane-Wave in Two Media.** K. Uller. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 123-152, February, 1920.]
- On the Absorption of Corpuscular Rays Penetrating the Terrestrial Atmosphere and following Non-Rectilinear Paths.** C. Störmer. [*Comptes Rendus*, 170, pp. 742-744, March 22nd, 1920.]
- Wireless Telegraphy and Telephony.** W. H. Eccles. [*Electrician*, 84, p. 296, March 12th, 1920.]
- Everyday Measurement of Inductance and Capacity in the Wireless Laboratory.** L. B. Turner. [*Radio Review*, 1, pp. 585-590, September, 1920.]
- The Power Required for Long-distance Transmission.** G. W. O. Howe. [*Radio Review*, 1, pp. 598-608, September, 1920.]
- On the Electrical Characteristics of Low Antennae.** R. Jaeger. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 318-321, April, 1920.]
- Theory of Antenna Resistance.** W. H. Eccles. [*Electrician*, 84, p. 370, April 2nd, 1920.]
- The Skin Effect and Flux Distribution of Conductors in Proximity to Iron.** A. Press. [*Physical Review*, 15, pp. 450-453, May, 1920.]
- A Differential Method of Measuring Capacity and Inductance with a Sensibility of 2×10^{-8} .** G. Falckenberg. [*Annalen der Physik*, 61, pp. 167-172, January 15th, 1920.]
- The Length of Path of the Newtonian Luminous Radiation and the Zones of Silence in Damped Radio Signals.** G. Sagnac. [*Comptes Rendus*, 170, pp. 800-803, March 29th, 1920.]

- Measurement of the Field Strength at Leghorn of the Annapolis Signals. The Need for Further Research.** G. W. O. Howe. [*Radio Review*, 1, pp. 652-655, October, 1920.]
- Antenna Constants and the Wavelengths of Antennae.** A. Press. [*Revue Générale de l'Électricité*, 7, pp., 547-552, April 24th, 1920.]
- Measurements of the Electromagnetic Field due to an Aeroplane Transmitter.** R. Baldus and R. Hase. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 354-391, May, 1920.]
- An A.C. Zero Method of Determining the Grid Sensibility of Amplifying Valves.** W. Schottky. [*Telegraphen- und Fernsprech-Technik*, 9, pp. 31-32, May, 1920.]
- The Calibration of Wavemeters by Means of Higher Harmonics.** R. von Ettenreich. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 236-240, March, 1920.]
- The Capacity of Rectangular Plates and a Suggested Formula for the Capacity of Aerials.** G. W. O. Howe. [*Radio Review*, 1, pp. 710-714, November, 1920.]
- Note on Radio Frequency Measurements.** C. Englund. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 326-333, August, 1920.]
- Radiation Direction Changes and Variations of Audibility.** C. Kinsley and A. Sobey. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 299-325, August, 1920.]
- Measurement of the Electromagnetic Field of Waves received during Transoceanic Radio Transmission.** G. Vallauri. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 286-298, August, 1920.]
- Experiments on the Filtering Out of the Harmonics from the Nauen Signals.** A. Meissner and K. W. Wagner. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 200-214, March; and pp. 392-406, May, 1920.]
- Electrical Oscillation in Antennas and Induction Coils.** A. Hund. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 424-430, October, 1920.]
- Quantitative Experiments with Coil Antennae in Radiotelegraphy.** L. W. Austin. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 421-423, October, 1920.]
- Electrostatically Coupled Circuits.** L. Cohen. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 434-437, October, 1920.]
- The Wavelength Relation for a Generalised Bessel's Antenna.** A. Press. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 441-447, October, 1920.]
- Calibration of Wavemeters.** [*Zeitschrift für Instrumentenkunde*, 40, pp. 120-121, June, 1920.]
- Measurement of Small Mutual Inductance.** [*Zeitschrift für Instrumentenkunde*, 40, pp. 122-123, June, 1920.]
- Electric Phenomena Occurring in High Levels in the Atmosphere.** S. Chapman. [*Journal of the Institution of Electrical Engineers*, 57 Supplement, pp. 209-222, October, 1920.]
- Wireless and the Electrical State of the Atmosphere.** J. Brun. [*Radioélectricité*, 1, pp. 241-247, October, 1920.]
- Measurement of the Chief Parameters of Triode Valves.** W. H. Eccles. [*Radio Review*, 1, pp. 283-285, March, 1920.]

TRANSMITTING APPARATUS.

- An Investigation of so-called Quenched Sparks.** V. Pieck. [*Jahrbuch der drahtlosen Telegraphie*, 15, pp. 40-67, January, 1920.]
- An Experiment of Impulse Excitation.** J. H. Morecroft. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 75-84, February, 1920.]

- Characteristic Curves of Frequency Doublers applied to Radiotelegraphic Transmission.** T. Minohara. [*Revue Générale de l'Électricité*, 7, pp. 283-291, February 28th, 1920.]
- Interesting Key Controls.** W. Dornig. [*Elektrotechnische Zeitschrift*, 41, pp. 367-368, May 13th, 1920.]
- The Poulsen System of Radiotelegraphy: History of Development of Arc Methods.** C. F. Elwell. [*Electrician*, 84, pp. 596-599, May 28th, 1920.]
- An Electron Tube Transmitter of Completely Modulated Waves.** L. M. Hull. [*Journal of Washington Academy of Sciences*, 10, pp. 316-323, June 4th, 1920.]
- High Frequency Alternators.** M. Latour. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 220-237, June, 1920.]
- A New Automatic Telegraph.** [*Electrician*, 85, p. 62, July 9th, 1920.]
- The Effect of Rarefied Atmosphere on Spark Transmitters.** F. Jentzsch-Graefe. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 311-317, April, 1920.]
- Experiments and Tests with Wireless High-speed Telegraphy.** F. Banneitz. [*Telegraphen- und Fernsprech-Technik*, 9, pp. 90-93, August, 1920.]
- Undamped Oscillation Generators.** M. Brossier. [*Radioélectricité*, 1, pp. 115-127, August, 1920; pp. 175-183, September, 1920; pp. 225-240, October, 1920.]
- The Self-Excitation of Alternators by Means of Condensers.** J. Bethenod. [*Radioélectricité*, 1 pp. 187-188, September, 1920.]

RADIOTELEPHONY.

- Wireless Telephony on Aeroplanes.** C. E. Prince. [*Journal of the Institution of Electrical Engineers*, 58, pp. 377-390, May, 1920.]
- Duplex Wireless Telephony: Some Experiments on its Application to Aircraft.** P. P. Eckersley. [*Journal of the Institution of Electrical Engineers*, 58, pp. 555-565, July, 1920.]
- Wireless Telephony.** N. H. Slaughter. [*Journal of the Franklin Institute*, 189, pp. 1-24, January, 1920.]
- High Frequency Telephony.** G. Beauvais. [*La T.S.F. Moderne*, 1, pp. 4-7, April, 1920.]
- Simultaneous Transmission and Reception in Radiotelephony.** N. Marumo. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 199-219, June, 1920.]
- Wireless Telephony.** W. H. Eccles. [*Nature*, 105, pp. 519-522, June 24th, 1920.]

RECEIVING APPARATUS.

- An Automatic Call Device.** B. Binyon. [*Wireless World*, 8, pp. 158-167, May 29th, 1920.]
- Some of the Problems of Atmospheric Elimination in Wireless Reception.** P. R. Coursey. [*Wireless World*, 8, pp. 191-201, June 12th, 1920.]
- Notes on Beat Reception.** L. W. Austin and F. G. Grimes. [*Journal of the Washington Academy of Sciences*, 10, pp. 174-177, March 19th, 1920.]
- Musical Reception with Continuous Waves without Local Oscillations.** L. W. Austin. [*Journal of the Washington Academy of Sciences*, 10, pp. 223-226, April 19th, 1920.]
- Amplification of Current in a Bunsen Flame.** C. W. Heaps. [*Physical Review*, 15, pp. 222-223, March, 1920; and pp. 238-246, September, 1920.]

- Radio-Frequency Interference Balance.** [Wireless Age, 7, pp. 21-23, December, 1919.]
- Unilateral Conductivity in Crystals.** F. Streintz and A. Wesley. [Physikalische Zeitschrift, 21, pp. 42-50, January 15th, 1920.]
- Use of Ground Wires at Remote Control Stations.** A. H. Taylor and H. Crossley. [Proceedings of the Institute of Radio Engineers, 8, pp. 171-192, January, 1920.]
- Two Types of Current Rectification by Galena.** Mlle. P. Collet. [Comptes Rendus, 170, pp. 1489-1491, June 21st, 1920.]
- Rectifying Action of Crystal Detectors.** M. J. Huizinga. [Physikalische Zeitschrift, 21, pp. 91-96, February 15th, 1920.]
- Receiving Aerials and Circuits.** G. Leithauser. [Jahrbuch Zeitschrift für drahtlose Telegraphie, 15, pp. 178-200, March, 1920.]
- Use of Ground Wires at Remote Control Stations.** E. W. Stone. [Proceedings of the Institute of Radio Engineers, 8, pp. 431-433, October, 1920.]
- Electric Elimination by Directional Reception.** G. W. Pickard. [Proceedings of the Institute of Radio Engineers, 8, pp. 358-415, October, 1920.]
- Electric Contact and Coherer Action.** H. Rohmann. [Physikalische Zeitschrift, 21, pp. 417-423, August 15th, 1920.]

RADIO INSTALLATIONS (INCLUDING DIRECTION FINDING).

- Method of Direction Finding with Wireless Waves.** J. Robinson. [Radio Review, 1, pp. 213-219, February, 1920; and pp. 265-275, March, 1920.]
- Location and Position Finding.** H. J. Round. [Journal of the Institution of Electrical Engineers, 58, pp. 224-257, March, 1920.]
- Automatic Sending Device Installed in the Alipur Observatory, Calcutta.** [Radio Review, 1, pp. 432-434, June, 1920.]
- First Aircraft Radio.** T. Johnson, Jr. [Proceedings of the Institute of Radio Engineers, 8, pp. 3-58, February, 1920; pp. 87-141, April, 1920.]
- Radio Telegraphic Station at Rome (San Paulo).** B. Micchiardi, G. Pession and G. Vallauri. [Proceedings of the Institute of Radio Engineers, 8, pp. 142-163, April, 1920.]
- Wireless Receiving Apparatus at Geltow (Potsdam).** [Elektrotechnische Zeitschrift, 41, pp. 41-42, January 8th, 1920.]
- Augereau System for the Reception of Signals on Locomotives.** [Revue Générale de l'Électricité, 7, pp. 506-507, April 10th, 1920.]
- Wireless Telegraphy and Aerial Navigation.** Franck. [L' Aéronautique, 1, pp. 291-295, December, 1919.]
- Directional Wireless on Aeroplanes.** E. Buchwald and R. Hase. [Jahrbuch Zeitschrift für drahtlose Telegraphie, 15, pp. 101-113, February, 1920.]
- Experiments with Scheller's Radio Course-Setter on Aeroplanes.** E. Buchwald. [Jahrbuch Zeitschrift für drahtlose Telegraphie, 15, pp. 114-122, February, 1920.]
- Experiments on Spark Radiotelegraphic Directive Transmission.** F. Liebitz. [Jahrbuch Zeitschrift für drahtlose Telegraphie, 15, pp. 299-310, April, 1920.]
- Contribution to the Study of Submarine Radio Communication.** L. Bouthillon. [Revue Générale de l'Électricité, 7, pp. 696-700, May 20th, 1920.]
- First Radiotelegraphic System.** [Electrician, 84, p. 678, June 18th, 1920.]
- Commercial Developments in Wireless.** H. MacCallum. [Radio Review, 1, pp. 685-695, November, 1920.]

- The Poulsen Arc Plant at Königswusterhausen.** H. Thurn. [*Telegraphen- und Fernsprech-Technik*, 9, pp. 37-42, June, 1920; pp. 55-60, July, 1920.]
- Experiments on Wireless Direction Finding in Aircraft.** R. Baldus and E. Buchwald. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 214-236, March, 1920.]
- Directive Wireless Telegraphy.** F. Kiebitz. [*Telegraphen- und Fernsprech-Technik*, 9, pp. 46-50, June, 1920.]
- The Windhuk Radio Station during the War.** W. Thiess. [*Telefunken Zeitung*, 4, No. 21, pp. 43-47, July, 1920.]
- Trans-oceanic Radio Communication.** E. F. W. Alexanderson. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 263-285, August, 1920.]
- Reception of W T Time Signals at the Royal Observatory, Greenwich.** W. Bowyer. [*Monthly Notices of the Royal Astronomical Society*, 80, pp. 648-650, May, 1920.]
- The Underground Radio Station at Paris.** [*Radioélectricité*, 1, pp. 15-18, June, 1920.]
- The "La Fayette" Radio Station.** [*Radioélectricité*, 1, pp. 79-81, July, 1920.]
- Wireless in the French Colonies.** [*Radioélectricité*, 1, pp. 129-140, August, 1920; pp. 189-197, September, 1920; pp. 248-255, October, 1920.]
- Radiotelephone Communication to and from Trains.** J. J. Graf. [*Radio News*, 1, pp. 398-399, February, 1920.]
- The Radio Compass.** J. H. Dellinger. [*Radio News*, 1, pp. 400-402, February, 1920.]
- Radio in Modern Aircraft.** A. J. Hall. [*Radio News*, 1, p. 539, April, 1920.]
- The Otter Cliffs Naval Receiving Station.** A. F. Wallis. [*Radio News*, 2 pp. 6-7, July, 1920.]

VALVES AND VALVE APPARATUS (INCLUDING AMPLIFIERS).

- The Kallitron, an Aperiodic Negative-Resistance Triode Combination.** L. B. Turner. [*Radio Review*, 1, pp. 317-329, April, 1920.]
- Oscillations obtained by Coupling a Secondary Circuit with a Continuous Wave Valve Oscillator.** J. S. Townsend. [*Radio Review*, 1, pp. 369-374, May, 1920.]
- Harmonics in C.W. Transmission.** L. A. T. Broadwood. [*Wireless World*, 8, pp. 82-91, May 1st, 1920; and pp. 125-131, May 15th, 1920.]
- A Thermionic Amplifier for Low-Anode Voltages.** E. Rückhardt. [*Jahrbuch der drahtlosen Telegraphie*, 15, pp. 27-39, January, 1920.]
- Electronic and Ionic Oscillations in Thermionic Valves.** G. W. O. Howe. [*Radio Review*, 1, pp. 434-436, June, 1920.]
- The Algebra of Ionic Valves.** W. H. Eccles. [*Electrician*, 84, pp. 162-163, February 13th, 1920.]
- The Dependence of the Amplification Constant and Internal Plate Circuit Resistance of a Three-Electrode Vacuum Tube upon the Structural Dimensions.** J. M. Miller. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 64-73, February, 1920.]
- Notes on the Theory and Calculation of Audio-Frequency Valve Magnifiers.** J. K. Catterson-Smith. [*Radio Review*, 1, pp. 473-480, July, 1920.]
- The Self-Oscillations of a Thermionic Valve.** R. Whiddington. [*Proceedings of the Cambridge Philosophical Society*, 19, p. 346, February, 1920.]
- On the Variations of Wavelength of the Oscillations Generated by Three-Electrode Thermionic Tubes due to Changes in Filament Current.** W. H. Eccles and J. H. Vincent. [*Proceedings of the Royal Society*, 96A, pp. 455-465, February 3rd, 1920.]

- The Effect of Ionization on a Characteristic Curve of a Three-Electrode Valve containing a Trace of Gas.** B. Hodgson and L. S. Palmer. [*Radio Review*, 1, pp. 525-531, August, 1920.]
- The Development of Thermionic Valves for Naval Uses.** B. S. Gossling, [*Journal of the Institution of Electrical Engineers*, 58, pp. 670-703, August, 1920.]
- Some Applications of Triodes to High-frequency Measurements.** G. Leithauser. [*Verhandlungen der deutschen Physikalischen Gesellschaft*, 1, Series 3, pp. 23-28, March 31st, 1920.]
- The Shortest Waves Produced with Vacuum Tubes.** H. Barkhausen and K. Kurz: [*Physikalische Zeitschrift*, 21, pp. 1-6, January 1st, 1920.]
- The Short Tungsten Filament as a Source of Light and Electrons.** G. Stead. [*Journal of the Institution of Electrical Engineers*, 58, pp. 107-117, January, 1920.]
- Triode Valves as Electric Amplifiers.** W. H. Eccles. [*Nature*, 104, pp. 501-502, January, 1920.]
- Thermionic Vacuum Tube as Detector, Amplifier and Generator of Electrical Oscillations.** W. H. Eccles. [*Electrician*, 84, pp. 522-524, May 7th, 1920.]
- Further Experiments on the Variation of Wavelength of the Oscillations generated by an Ionic Valve due to Changes in Filament Current.** J. H. Vincent. [*Proceedings of the Royal Society*, 97A, pp. 191-196, April 15th, 1920.]
- Absorption of Gases in the Electric Discharge Tube.** F. H. Newman. [*Proceedings of the Physical Society of London*, 32, pp. 190-195, April 15th, 1920.]
- Measurement of the Chief Parameters of Triode Valves.** W. H. Eccles. [*Proceedings of the Physical Society of London*, 32, pp. 92-104, February 15th, 1920.]
- The Oscillatory Valve Relay : A Thermionic Trigger Device.** L. B. Turner. [*Journal of the Institution of Electrical Engineers*, 57 Supplement, pp. 50-65, April, 1920.]
- Electron Tube Generators of Alternating Currents of Ultra-Radio Frequencies.** G. C. Southworth. [*Radio Review*, 1, pp. 577-584, September, 1920.]
- Some Notes on Vacuum Tubes.** J. H. Morecroft. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 239-260, June, 1920.]
- On the Theory of Ionization by Collision.** P. O. Pedersen. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 289-299, April, 1920.]
- The Thermionic Valve in Wireless Telegraphy and Telephony.** J. A. Fleming. [*Engineering*, 109, p. 760, June 4th, 1920.]
- The Evolution of the Low Frequency Amplifier during the War.** H. Dubosq. [*La T.S.F. Moderne*, 1, pp. 11-18, April, 1920; and pp. 41-47, May, 1920.]
- Regeneration and Oscillation in Vacuum Tube Circuits through Inter-Electrode Tube Capacity.** A. S. Blatterman. [*Radio Review*, 1, pp. 633-643, October, 1920.]
- Notes on the Physics of the Thermionic Valve.** T. G. Petersen. [*Wireless World*, 7, pp. 566-572, January; pp. 638-644, February; pp. 686-690, March, 1920.]
- On the Input Impedance of the Thermionic Amplifier.** S. Ballantine. [*Physical Review*, 15, pp. 409-420, May, 1920.]
- A Theory of the Amplitude of Free and Forced Triode Vibrations.** Balth van der Pol, Jnr. [*Radio Review*, 1, pp. 701-710, November, 1920.]
- The Audion Oscillator.** R. A. Heising. [*Journal of the American Institute of Electrical Engineers*, 39, pp. 365-376, April, 1920; and pp. 471-478, May, 1920.]

- Note on the Input Impedance of Vacuum Tubes at Radio Frequency.** S. Weinberger. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 334-341, August, 1920.]
- A Method of Amplifying Electrical Variations of Low Frequency.** W. H. Eccles and F. W. Jordan. [*Electrician*, 85, p. 176, August 13th, 1920.]
- High Frequency Amplifiers and Frame Antennæ.** R. Ettenreich. [*Verhandlungen der deutschen Physikalischen Gesellschaft*, 1, pp. 66-67, June 14th, 1920.]
- Graphical Theory of Audion Generators and the Calculation of the Amplitude of the Oscillation.** A. Blondel. [*Radioélectricité*, 1, pp. 7-13, June, 1920; and pp. 63-72, July, 1920.]
- The Vacuum Tube in Radiotelegraphy.** M. Brossier. [*Radioélectricité*, 1, pp. 19-32, June, 1920; and pp. 82-91, July, 1920.]
- The Armstrong Super-Autodyne Amplifier.** H. W. Houck. [*Radio News*, 1, pp. 403-405, February, 1920; and pp. 469-471, March, 1920.]
- French Applications of the Vacuum Tube.** Capt. Metz. [*Radio News*, 1, pp. 608-609, May, 1920; pp. 678-680, June, 1920.]
- Radio Frequency Amplification.** A. S. Blatterman. [*Radio News*, 2, pp. 140-142, September, 1920.]

MISCELLANEOUS ARTICLES.

- Wireless Stations as Competitors with Line Telegraphy and Telephony.** E. Nesper. [*Jahrbuch der drahtlosen Telegraphie*, 15, pp. 69-72, January, 1920.]
- Wireless Press Service.** Communicated by the Gesellschaft für drahtlosen Telegraphie. [*Jahrbuch der drahtlosen Telegraphie*, 15, pp. 72-76, January, 1920.]
- The Report of the Imperial Wireless Telegraphy Committee, 1919-1920.** G. W. O. Howe. [*Radio Review*, 1, pp. 543-544, August, 1920.]
- Imperial Wireless Communications.** [*Electrical Review*, 86, p. 337, March, 12th; pp. 377-379, March 19th, 1920.]
- Is Wireless Telegraphy suitable as a Means of Communication in Large Electric Power Distribution Systems?** G. Schmidt. [*Telegraphen- und Fernsprech-Technik*, 9, pp. 16-17, April, 1920.]
- Experiments on the Distribution of Reports by Wireless Telephony.** W. Hahn. [*Elektrotechnische Zeitschrift*, 41, pp. 727-729, September, 16th, 1920.]

(C) STANDARD PUBLICATIONS ON WIRELESS, and Subjects intimately connected with Wireless Research and Development.

(1) BOOKS.

NOTE.—All Books marked with an asterisk (*) are notified by the Publishers as temporarily out of print. Copies of all other Books and Periodicals may be obtained from the Mail Order Department, THE WIRELESS PRESS, LTD., 12-13, Henrietta Street, London, W.C.2.

In cases where the names of two publishers in different countries are quoted against any particular book, the one placed first indicates the country in which the book was first published.

BELGIUM.

- Aperçu sur la Télégraphie sans Fils en Belgique.** Paul Dubois. [Liège : Imprimerie La Meuse. Pp. 120.]

- A Propos de Télégraphie sans Fils** (La Loi du 8 Juillet 1908, et les Signaux F L). M. L. Vandevyver. [Ghent: *H. Rousseuw*. 1912. Pp. 20. Price 2 frs.]
- De l'Emploi des Appareils de Télégraphie sans Fil pour l'Observation des Courants Atmosphériques dans les Régions Polaires.** A. Boutquin. [Brussels: *Veuve Ferd. Larcier*. 1907. Pp. 16. Price 0.75 fr.]
- La Captation ou la Réception des ondes Hertziennes.** A. Boutquin. [Brussels: *Veuve Ferd. Larcier*. 1913. Pp. 13. Price 1 fr.]
- *La Télégraphie sans Fil à Travers les Âges.** M. Pierard. [Brussels University.]
- La Télégraphie sans fil au Congo Belge.** R. B. Goldschmidt and R. Braillard. [Brussels: *M. Hayez*. Pp. 120.]
- Secret de la Correspondance and Monopole radiotélégraphiques.** M. L. Vandevyver. [Ghent: *H. Rousseuw*. 1913. Pp. 26. Price 2 frs.]
- Télégraphie sans Fil.** L. van Aerschodt. [Brussels: *Veuve Ferd. Larcier*. 1913. Pp. 27. Price 0.50 fr.]
- Télégraphie sans Fil Appliquée à la Météorologie aux Provisions du Temps et à l'étude de la Physique du Globe.** A. Boutquin. [Brussels: *Veuve Ferd. Larcier*. 1911. Pp. 40. Price 1 fr.]
- Télégraphie sans Fil et la Téléphonie sans Fil.** F. Fontaine. [Liège: *Imprimerie La Meuse*. 1911. Pp. 115. Price 3 frs.]

BRAZIL.

- Radiotelegraphia e sua applicacao no Brasil.** Francisco Bhering.
- Radiotelegraphia no Brasil.** Francisco Bhering. [*Imprensa Nacional*. 1914. Pp. 341.]
- Telegraphia sem fio.** Francisco Bhering. [*Typographia Nacional*. 1914. Pp. 101.]
- Telegraphia sem fio e seus ultimos melhoramentos.** Francisco Bhering. [*Typographia Nacional*. 1908. Pp. 52.]
- Telegraphia sem fio e Cartographos Conferencia.** Francisco Bhering. [*Typographia Esperança*. 1914.]
- Telegrapho sem fio.** Ricardo Frederico de Limã. [Rio de Janeiro: *Officina Typographica da Escola Gerson*.]

DENMARK.

- Laerebog i traadlos Telegrafi.** O. Lund Johansen. [Copenhagen K.: *G. E. C. Gad*, Vimmelskaffet, 32. Price kr. 11.00.]
- Moderne Radiomodlagere Elektronrørets Teori og Anvendelse.** [Copenhagen K.: *G. E. C. Gad*, Vimmelskaffet, 32. Price kr. 3.00.]

FRANCE.

- Applications de la Télégraphie sans Fil.** F. Rothe. [Paris: *Librairie Beger-Levrault*, 5-7, Rue des Beaux Art. Fourth edition. 1918. Price 6.80 frs.]
- Applications de la Télégraphie sans Fil.** P. Jégou. [Paris: *Librairie Desforges*. Pp. 70. Price 2.25 frs.]
- *Carnet d'Enregistrement des Dépêches Météorologiques Transmises par Télégraphie sans Fil.** [Paris: *O. Michel*, 22, Rue Huyghens. 2nd edition. Price 1 fr.]
- Cours Élémentaire de Télégraphie sans Fil.** G. Viard. [Paris: *Librairie de l'Enseignement Technique*, 3, Rue Thenard. Pp. 300. Price 15 frs.]
- Éléments de Télégraphie sans Fil Pratique.** F. Duroquier. [Paris: *Dunod*, 47-49, Quai des Grands-Augustins. 2nd edition. 1920. Pp. 130. Price 7 frs.]

- Étude de quelques Problèmes de Radiotélégraphie.** H. de Bellescize. [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. Pp. 174. Price 16 frs.]
- Introduction à la Théorie des Courants Téléphoniques et de la Radiotélégraphie.** J. B. Pomey. [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. Pp. xiv+510. Price 50 frs.]
- Introduction à l'Étude des Radiocommunications.** L. Bouthillon. [Paris: *Delagrave*, 15, Rue Soufflot. 1919. Pp. ix+193. Price 20 frs., or 28 frs. cloth.]
- Les Applications de la Physique pendant la Guerre.** H. Vigneron. [Paris: *Masson et Cie.*, 120, Boulevard Saint-Germain. Pp. viii+322. Price 7 frs. net.]
- Les Tubes à Vide en Radiotélégraphie.** P. Dapsence. [Paris XIe: *G. Péricaud*, 85, Boulevard Voltaire. Price 1.50 frs.]
- Manuel Élémentaire de Télégraphie sans Fil.** C. Tissot. [Paris: *Augustin Challamel*, 17, Rue Jacob. Fifth edition. 1918. Price 12 frs.]
- Memoire facile de l'induction entre spires.** P. Dapsence. [Paris XIe: *G. Péricaud*, 85, Boulevard Voltaire. Price 0.50 frs.]
- Notions Élémentaires et Pratiques de T.S.F. À l'Usage des Personnes voulant Recevoir les Signaux Horaires et les Dépêches Météorologiques de la Tour Eiffel.** E. Baudran. [Paris: *O. Michel*, 22, Rue Huyghens. Price 3.75 frs.]
- Nouveau Manuel Pratique de T.S.F.** P. le Graverend. [Paris, XIe: *G. Péricaud*, 85, Boulevard Voltaire. Sixth edition. Pp. 72. Price 1.75 frs.]
- Oscillations Électriques (Principes de la Télégraphie sans Fil).** C. Tissot. [Paris, VIe: *Gaston Doin*, 8, Place de l'Odéon. Second edition.]
- Oscillations Electro-magnétiques et la Télégraphie sans Fil.** J. Zenneck. Translated from the German by Blanchin, Guérard et Picot. [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. 2 vols. Price 34 frs. each.]
- Précis de Télégraphie sans Fil.** J. Zenneck. Translated from the German by Blanchin, Guérard et Picot. [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. Price 24 frs.]
- Principes Élémentaire de Télégraphie sans Fil.** R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12-13, Henrietta Street, W.C.2. Pp. xii+249. Price 9s.]
- Radiotélégraphie, Notions et Conseils Pratiques.** M. Magny. [Paris: *O. Michel*, 22, Rue Huyghens. Price 2 frs.]
- Radiotélégraphie Pratique et Radiotéléphonie.** P. Maurer. [Paris: *Dunod*, 47-49, Quai des Grands-Augustins. 1920. Pp. 386. Price 21 frs.]
- Réception des Signaux Horaires Radiotélégraphiques,** Bureau des Longitudes. [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. Second edition. Price 5.50 frs.]
- Signaux Horaires et Radiotélégrammes Météorologiques transmis chaque jour par la Tour Eiffel.** [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. Price 2.50 frs.]
- Technique de la Radiotélégraphie.** Rein. [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. Price 18 frs.]
- Télégraphie sans Fil, Applications Pratiques des Ondes Électriques.** A. Turpain. [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. Second edition, 1908. Price 24 frs.]
- Télégraphie sans Fil.** Berget. [Paris: *Hachette*. Price 5 frs.]
- Télégraphie sans Fil.** André Broca. [Paris: *Gauthier-Villars et Cie.*, 107, Boulevard Saint-Germain. Second edition. Price 8.00 frs.]

- Télégraphie sans Fil.** E. Constet. [Paris : *Charles Mendel*, 118, Rue d'Assas. Pp. 100. Price 2 frs.]
- Télégraphie sans Fil.** E. Petit and L. Bouthillon. [Paris : *Librairie Delagrave*, 15, Rue Soufflot. Pp. vii+304. Price 15 frs.]
- T.S.F. Vade-mecum de l'Amateur sans-filiste.** S. Mariens. [Paris : *Librairie Amat.* Price 5 frs.]
- Télégraphie sans Fil et la Loi.** A. Perret-Maisonneuve. [Paris : *H. Desforges*, 29, Quai des Grands-Augustins. Price 10.50 frs.]
- ***Télégraphie sans Fil (la Télémechanique et la Téléphonie sans Fil à la Portée de Tout le Monde).** R. Monier. [Paris : *Librairie Dunod*. Pp. 242. Price 5.25 frs.]
- Télégraphie sans Fil et les Ondes Électriques.** J. Boulanger et G. Ferrié. [Paris : *Librairie Berger-Levrault*, 5-7, Rue des Beaux Arts. Ninth edition, 1918. Pp. 487. Price 15 frs. Cloth, 20 frs.]
- T S.F. Manuel Pratique de l'Amateur.** [Paris : *Librairie Desforges*, 29, Quai des Grands Augustins. Price 6 frs.]
- Télégraphie sans Fil (Réception des Signaux Horaires et des Télégrammes Météorologiques).** Docteur P. Corret. [Paris : *Edition du Cosmos*, 5, Rue Bayard. Pp. 725.]
- ***Télégraphie sans Fil dans les Rapports Internationaux.** Devaux Jacques. [A. Pedone, 1914. Price 4.80 frs.]
- ***Téléphonie sans Fil.** Scheidt-Boon. [Valenciennes : 36, Rue de Mons. 1914.]
- Théorie de la T.S.F. par Analogies Mécaniques.** P. Dapsence. [Paris, XI^e : *G. Péricaud*, 85, Boulevard Voltaire. Second edition. Pp. 92. Price 1.75 frs.]
- Théorie de Maxwell et les Oscillations Hertiennes. La Télégraphie sans Fil.** H. Poincaré. [Paris : *Gauthier-Villars et Cie*, 107, Boulevard Saint Germain. Third edition, 1908. Pp. 100. Price 6 frs.]
- Théorie Générale de l'Electromagnetisme.** G. E. Pineau. [Paris : *Dunod*, 47-49, Quai des Grands-Augustins. Pp. 72. Price 7 frs.]
- Théorie Simplifiée de la Télégraphie sans Fil.** Verdurand. [Paris : *Dunod*, 47-49, Quai des Grands-Augustins. 1917. Price 4 frs.]
- Vocabulaire de Télégraphie et Téléphonie sans Fil en Cinq Langues.** H. Viard. [Paris : *Gauthier-Villars et Cie.*, 107, Boulevard Saint Germain. Pp. x+108. Price 15 frs.]

GERMANY.

- Drahtlose Telegraphie und ihr Einfluss auf den Wirtschaftsverkehr, unter besonderer Berücksichtigung des Systems Telefunken.** E. Vesper. [Berlin : *Julius Springer*. 1905. Price 4.95 marks.]
- Drahtlose Telegraphie.** G. Eichhorn. [Berlin, W.10. : *Walter de Grayter & Co.* 1904. Price 5s.]
- ***Drahtlose Telegraphie und Telephonie.** G. Partheil. [Berlin : *Gerdas und Hndel*. Second edition, 1911. Price 6 marks.]
- Elektrische Lichtbogen.** H. Th. Simon. [Leipzig : *Hirzel*, Königstrasse, 2. 1911. Price 1s. 5d.]
- ***Elektrischen Wellentelegraphie.** O. Arendt. [Brunswick : *Fr. Vieweg und Sohn*. 1907. Price 10.5 marks.]
- ***Elektromagnetische Schwingungen und Drahtlose Telegraphie.** J. Zenneck. [Stuttgart : *Ferd. Enke*. 1905. Price 28 marks.]
- Entdeckungsfahrten in den elektrischen Ozean.** A. Slaby. [Berlin : *Leonhard Simion*. 1911.]

- ***Experimentelle Untersuchungen aus dem Grenzgebiet zwischen drahtloser Telegraphie und Luftelektrizität.** M. Dieckmann. [Berlin: *Julius Springer*. 2 vols., 1912. Price 4.95 marks.]
- ***Fortschritte auf dem Gebiete der drahtlosen Telegraphie.** A. Prasch. [Stuttgart: *Ferd. Enke*. 1906. Price 8.40 marks.]
- Frequenzmesser und Dämpfungsmesser.** E. Nesper. [Berlin, W.10: *Walter de Grayter & Co.* 1907. Price, 11s.]
- ***Funkentelegraphie.** A. Slaby. [Berlin: *Julius Springer*. 1897. Price 2 marks.]
- Funkentelegraphie im Recht.** H. Thurn. [Munich: *J. Schweitzer*, 1913. Price 6 marks.]
- Grundriss der Funkentelegraphie in gemeinverständlicher Darstellung.** F. Fuchs. [Munich: *R. Oldenburg*. Eleventh edition, 1920. Pp. 73. Price 1s. 5d.]
- Handbuch für Funkentelegraphisten.** O. Ohlsberg. [Berlin: *Decker*. Second edition, 1918. Price 37.80 marks.]
- ***Lehrbuch der Drahtlosen Telegraphie.** J. Zenneck. [Stuttgart: *Ferd. Enke*. 1913. Price 15 marks.]
- Lehrbuch der Drahtlosen Telegraphie und Telephonie.** Franz Anderle. [Leipzig and Vienna: *Franz Deuticke*. Fourth edition, 1918. Price 8s. 5d.]
- Leitfaden der Drahtlosen Telegraphie für die Luftfahrt.** Max Dieckmann. [Munich: *R. Oldenburg*. Pp. 214. Price 7s. 2d.]
- Lichtbogen als Wechselstromerzeuger.** H. K. W. Wagner. [Leipzig: *S. Hirzel*, Königstrasse 2. 1910. Price 2s. 6d.]
- ***Physik des Aethers auf Elektromagnetischer Grundlage.** P. Drude. [Stuttgart: *Ferd. Enke*. New edition, edited by W. König. 1912. Price 16 marks.]
- ***Physikalische Grundlagen der Elektrotechnik.** F. F. Martens. [Brunswick: *Vieweg und Sohn*. Second edition. Price 21 marks.]
- Radiotelegraphie.** O. Nairz. [Leipzig: *J. A. Barth*. 1908.]
- ***Radiotelegraphische Gleichstrom-Tonsender.** H. Rein. [Berlin: *Julius Springer*. 1912.]
- ***Radiotelegraphisches Praktikum.** H. Rein. [Berlin: *Julius Springer*. Second edition, 1904. Price 8 marks.]
- ***Telegraphie ohne Draht.** A. Righi and B. Dessau. [Brunswick: *Vieweg und Sohn*. Second edition, 1907. Price 24.75 marks.]
- ***Telegraphie und Telephonie ohne Draht.** Otto Jentsch. [Berlin: *Julius Springer*. 1904. Price 5 marks.]
- ***Telephonie ohne Draht.** H. Markau. [Brunswick: *Vieweg und Sohn*. Second edition, 1907. Price 7.8 marks.]

GREAT BRITAIN.

- A Short Course in Elementary Mathematics and Their Application to Wireless Telegraphy.** S. J. Willis. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1917. Pp. 182. Price 3s. 6d.]
- Alternating Current Work.** W. Perren Maycock. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Price 7s. 6d.]
- Alternating Current Work: An Outline for Students of Wireless Telegraphy.** A. Shore, A.M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. ix+163. Price 3s.]
- Amateur Operator's Diary and Notebook 1920.** [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 4s. 6d.]

- Autobiography of an Electron.** Charles R. Gibson, F.R.S.E. [London : Seeley, Service & Co., 38, Great Russell Street, W.C.1. 1911. Pp. 215. Price 5s. net.]
- Calculation and Measurement of Inductance and Capacity.** W. H. Nottage, B.Sc. [London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1916. Pp. 144. Price 3s. 6d.]
- Decimal Tables.** Sir G. L. Molesworth, K.C.I.E., M.Inst.C.E. [London : *E. and F. N. Spon*, 57, Haymarket, S.W.1. 1919. Pp. 118. Price 2s. 6d.]
- Electric Oscillations and Electric Waves.** G. W. Pierce. [New York : *McGraw-Hill Book Co., Inc.* ; London : *McGraw-Hill Publishing Co., Ltd.* 6/8, Bouverie Street, E.C. 4. Pp. ix+517. Price 30s. net.]
- Electric Waves.** H. Hertz. (Translated by D. E. Jones, B.Sc.). [London : *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. 1900. Pp. 298. Price 12s. 6d.]
- Electromagnetic Theory of Light.** Part I. C. E. Curry, Ph.D. [London : *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Pp. 416. Price 12s.]
- Electron Theory : a Popular Introduction to the New Theory of Electricity and Magnetism.** E. E. Fournier-d'Albe, B.Sc. [London : *Longmans, Green & Co.*, 39, Paternoster Row, E.C. 1906. Pp. xxii+312. Price 7s. 6d.]
- Elements of Electromagnetic Theory of Light.** L. Silberstein, Ph.D. [London : *Longmans, Green & Co.*, 39, Paternoster Row, E.C. 1919. Pp. 48. Price 4s.]
- Elements of Radiotelegraphy.** Ellery W. Stone, M.Inst.R.E. [New York : *D. van Nostrand Co.* London : *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C. 1920. Pp. vii+267. Price 16s. 6d. net.]
- Elementary Lessons in Electricity and Magnetism.** Silvanus P. Thompson, D.Sc., F.R.S. [London : *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. New issue, 1915. Price 5s. 6d.]
- Elementary Manual of Radiotelegraphy and Radiotelephony for Students and Operators.** Dr. J. A. Fleming, F.R.S. [London : *Longmans, Green & Co.*, 39, Paternoster Row, E.C. Third edition—New impression, 1919. Pp. xiv+355. Price 10s. 6d.]
- Elementary Practical Mathematics.** F. Castle. [London : *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 4s.]
- Elementary Principles of Wireless Telegraphy.** Parts I and II. R. D. Bangay. [London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1918. Pp. 212. Price 3s. each ; in 1 vol., 6s.]
- Experiments with Alternate Currents of High Potential and High Frequency.** Nikola Tesla. [New York : *McGraw-Hill Book Co. Inc.* London : *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. 1914. Price 6s.]
- Formulae and Tables for the Calculation of Alternating Current Problems.** Louis Cohen. [New York : *McGraw-Hill Book Co. Inc.* London : *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 282. Price 18s.]
- Handbook of Technical Instruction for Wireless Telegraphists.** J. C. Hawkhead. Revised by H. M. Dowsett, M.I.E.E. [London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Second edition—Fifth impression, 1918. Pp. 344. Price 6s.]
- Handbook of Wireless Telegraphy.** Dr. J. Erskine-Murray. [London : *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C. Pp. 442. Price 12s. 6d.]

- Hints for Wireless Designs for Amateurs.** "Alfred." [London: *Benn Bros., Ltd.*, 8, Bouverie Street, E.C.4. 1914. Pp. 55. Price 3s.]
- History of the Theories of Aether and Electricity, from the Age of Descartes to the Close of the Nineteenth Century.** Dr. E. T. Whittaker, F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C. Price 12s. 6d.]
- How to Become a Wireless Operator.** Charles B. Hayward. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C. Price 12s.]
- Intermediate Text Book of Magnetism and Electricity.** G. F. Woodhouse, M.A. [Sedburgh, Yorks: *Jackson & Son*. Revised, with additions, 1919. Price 7s. 6d.]
- Ionic Valve: a Guide to the Study of its Development and Application to Wireless Work.** W. D. Owen. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Pp. vii+59. Price 2s. 6d.]
- Magnets and Electric Currents.** J. A. Fleming, M.A., D.Sc. [London: *E. and F. N. Spon*, 57, Haymarket, S.W.1. Second edition. 1902. Pp. xv+408. Price 6s.]
- Magnetism and Electricity for Beginners.** H. E. Hadley, B.Sc. [London: *Macmillan & Co.*, St. Martin's Street, W.C.2. Price 3s. 6d.]
- Magnetism and Electricity for Home Study.** H. E. Penrose. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1918. Pp. 515. Price 5s.]
- Maintenance of Wireless Telegraph Apparatus.** P. W. Harris. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Second impression, 1918. Pp. x+127. Price 2s. 6d.]
- Making Wireless Outfits: an Explanation of the Construction and Use of an Inexpensive Wireless Equipment for Sending and Receiving up to 100 Miles.** Newton Harrison. [London: *E. and F. N. Spon*, 57, Haymarket, S.W.1. 1909. Pp. 61. Price 2s. 6d.]
- Manual de Instrucción Técnica para Operadores de Telegrafía sin Hilos.** J. C. Hawkhead and H. M. Dowsett. Translated by C. Ortega. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. xvi+332. Price 9s. net.]
- Manual of Radiotelegraphy.** Captain S. S. Robinson, U.S.N. [Annapolis, U.S.A.: *The United States Naval Institute*. London: *S. Rennell & Co., Ltd.*, 36, Maiden Lane, W.C.2. Fifth edition, 1919. Price 10s. net.]
- Marine Wireless Pocket Book.** W. H. Marchant. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2.] *In the Press.*
- *Maxwell's Theory and Wireless Telegraphy.** H. Poincaré and F. K. Vreeland. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Price 10s. 6d.]
- Methods of Measuring Electrical Resistance.** E. F. Northbury, Ph.D. [London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 390. Price 24s.]
- Miscellaneous Papers.** H. Hertz. Translated by D. E. Jones and G. A. Schott. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 12s. 6d.]
- Modern Theories of Physical Phenomena, Radio-activity, etc.** Augusto Righi. Translated by A. Trowbridge. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Pp. 180. Price 6s.]
- Morse Made Easy: a New Card for Rapidly Learning the Morse Code.** [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 3½d.]
- Oscillation Valve.** R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. 215. Price 5s.]

- Plans and Specifications for Wireless Telegraph Sets.** A. F. Collins. Part I: One to Five Miles. [London: *E. and F. N. Spon*, 57, Haymarket, S.W.1. 1909. Price 2s. 6d.]
- Plans and Specifications for Wireless Telegraph Sets.** Part II: Five to Ten Miles. [London: *E. and F. N. Spon*, 57, Haymarket, S.W.1. Price 2s. 6d.]
- Pocket Book (the Wireless Telegraphists') of Notes, Formulae and Calculations.** (Containing Formulae, Tables and Examples of Calculations Required in Practical Radiotelegraphy.) J. A. Fleming, M.A., D.Sc., F.R.S. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1915. Pp. 347. Price 9s.]
- Pocket Dictionary of Technical Terms Used in Wireless Telegraphy.** Harold Ward. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. New edition, 1919. Pp. 253. Price 2s. 6d.]
- Practical and Experimental Wireless Telegraphy.** W. J. Shaw. [London: *E. and F. N. Spon*, 57, Haymarket, S.W.1. 1914. Pp. 102. Price 5s.]
- Practical Telephone Handbook.** J. Poole. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Sixth edition. Price 12s. 6d.]
- Practical Uses of the Wavemeter in Wireless Telegraphy.** J. O. Mauborgne. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6-8, Bouverie Street, E.C.4. Pp. 74. Price 6s.]
- Practical Wireless Slide Rule.** Dr. H. R. Hickman. [London: *Benn Bros., Ltd.*, 8, Bouverie Street, E.C.4. Price 3s. 6d.]
- Principes Élémentaires de Télégraphie sans Fil.** R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. xii + 249. Price 9s.]
- Principios Elementales de Telegrafia sin Hilos.** R. D. Bangay. Translated by C. Ortega. Parts I and II. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 10 pesetas.]
- Principles and Practice of Electrical Testing as applied to Apparatus, Circuits and Machines.** R. G. Allen, B.Sc., A.R.C.Sc.I., A.M.I.E.E. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C. Pp. 363. Price 18s.]
- Principles of Electric Wave Telegraphy and Telephony.** Dr. J. A. Fleming, F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C. Fourth edition, revised 1919. Pp. xv + 707. Price 42s.]
- Principles of Radiotelegraphy.** C. M. Jansky. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 242. Price 15s. net.]
- Principles of Wireless Telegraphy.** G. W. Pierce. [London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 350. Price 18s.]
- Radio Communication.** John Mills. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. 1918. Pp. 205. Price 10s. 6d.]
- Radiodynamics.** B. F. Meissner. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C. Price 12s.]
- Radio Engineering Principles.** H. Lauer, B.S., and H. L. Brown, B.E.E. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. xv + 300. Price 21s. net.]
- Scientific Ideas of To-day.** Charles R. Gibson, F.R.S.E. [London: *Seeley, Service & Co.*, 38, Great Russell Street, W.C.1. Pp. 344. Price 7s. 6d. net.]
- Selected Studies in Elementary Physics.** A Handbook for the Wireless Student and Amateur. E. Blake, A.M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. viii + 176. Price 5s. net.]

Standard Tables and Equations in Radiotelegraphy. Bertram Hoyle. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. 159. Price 6s.]

***Story of Wireless Telegraphy.** Alfred T. Story. [London: *Hodder & Stoughton*, St. Paul's House, Warwick Square, E.C. Pp. 225. Price 1s.]

Studies in Terrestrial Magnetism. Dr. C. Chree, F.R.S. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 6s. 6d.]

Submarine Telegraphs, with an Appendix on Wireless Telegraphy. Charles Bright, F.R.S.E. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C. Pp. 800. Price £3 3s.]

Telegraphy, Telephony and Wireless. Joseph Poole. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Price 3s. net.]

Telephony without Wires. P. R. Coursey, B.Sc., A.M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. xi+414. Price 15s.]

Telephonic Transmission, Theoretical and Applied. J. G. Hill. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C. Pp. xvi+398. Price 21s. net.]

Test Questions in Wireless Telegraphy. In Card Form: Three Series. (These Test Cards are based on the "Elementary Principles of Wireless Telegraphy," "Handbook of Technical Instruction for Wireless Telegraphists," and other well-known textbooks, and are arranged to form a system of self-examination whereby the student may check his progress.) [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 2s. each series; answers separate.]

Textbook on Wireless Telegraphy. R. Stanley, B.A., M.I.E.E. In 2 vols.: (I) General Theory and Practice; pp. xiii+471; (II) Valves and Valve Apparatus; pp. viii+357. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C. 1919. Price 15s. each vol.]

Thermionic Valve and its Developments in Radiotelegraphy and Telephony. J. A. Fleming, D.Sc., F.R.S. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. xv+280. Price 15s.]

Useful Notes on Wireless Telegraphy. H. E. Penrose. In Five Booklets. Book I, "Direct Current," pp. 65; Book II, "Alternating Current," pp. 50; Book III, "High Frequency Current and Wave Production," pp. 66; Book IV, "The Marconi $1\frac{1}{2}$ kW. Ship Set," pp. 77; Book V, "The Oscillation Valve," pp. 53. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Price 1s. 4d. each.]

Waves and Ripples in Water, Air and Aether—Being a Course of Lectures delivered at the Royal Institution of Great Britain. J. A. Fleming, M.A., D.Sc., F.R.S., etc. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 300. Price 7s. 6d.]

Wireless Operator's Diary and Note Book. Published annually. A Leather Pocket-book, with Diary and Notebook specially ruled for Wireless Operators. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1920. Price 4s. 6d.]

Wireless Telegraphy. Professor C. Fortescue. [London: *Cambridge University Press*, Fetter Lane, E.C.4. Price 2s. 6d. net.]

Wireless Telegraphy. Gustav Eichhorn, Ph.D. [London: *Charles Griffin & Co., Ltd.*, 12, Exeter Street, W.C.2. 1906. Pp. x+116. Price 10s. 6d.]

Wireless Telegraphy. W. H. Marchant. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Second edition, 1920. Pp. ix+305. Price 7s. 6d.]

AMATEUR WIRELESS IN THE UNITED KINGDOM

BY E. BLAKE, A.M.I.E.E.

FOR the first time since the fateful year of 1914 we are able to chronicle a really satisfactory record of amateur wireless activity. The year 1919 found large numbers of pre-war and would-be amateurs either still in uniform or still not firmly bedded down to civilian life, and, further, the official regulations governing the practice of private wireless had barely emerged from the war-paint laid on by D.O.R.A. Here and there, keen experimenters gifted with both faith and patience had secured temporary, informal permission to indulge in a little innocuous wireless reception, but the great bulk of those interested hardly knew what was the position, whilst the clubs, the backbone of the movement, had only in a few cases recommenced operations.

On July 24th, 1919, the Committee of the Wireless Society of London met with a view to an early resumption of the Society's meetings, and the announcement was afterwards made that the society's officials had appointed a Committee to co-operate with the Post Office in the work of sifting applications for licences. The first general meeting held since the outbreak of the war took place on October 28th, 1919, during the course of which Mr. F. Hope-Jones, the chairman of the society, broached the subject of the affiliation of the suburban and provincial clubs to that body.

At a meeting of the Wireless Society of London, held on November 26th, 1919, it was announced that the society had appointed as its official organ *The Wireless World*, which periodical has since published full reports of all the society's proceedings and assisted it to consolidate the amateur movement. At a meeting of the same society on January 29th, Mr. F. Hope-Jones reported further progress with regard to the scheme for affiliation, the idea being so sound that the wireless clubs were not slow to adopt it. The definite rules of affiliation for the year 1920 were as follows:—

- (1) That an affiliated club should pay £1 1s. per annum as subscription, and £1 1s. entrance fee.
- (2) That such a club should adopt a subtitle, "Affiliated with the Wireless Society of London."
- (3) That affiliated clubs should name each year, say in January, one member (probably the President or Hon. Secretary), who will be during the year a member of the Wireless Society of London, and to whom all notices, etc., of the Society will be sent.
- (4) That each affiliated club shall receive twelve free reprints of the Wireless Society's monthly lectures, and as many more as required at cost price plus postage.
- (5) That members of affiliated clubs be invited to attend meetings of the W.S.L. when in London, a letter of introduction being given from the Hon. Secretary of the provincial or suburban club.
- (6) That an annual conference or convention be held in London, all members of provincial or suburban clubs being invited.

The first Annual Conference of the wireless clubs of this country was held at the Royal Society of Arts, on February 27th, 1920, under

the auspices of the F.R.S.E., M.Inst.C.E., F.R.G.S., F.S.S., etc., of the Post Office, and concerning the policy of his remarks the regulations of the force. (Vide pp. 46

the auspices of the Wireless Society of London. Sir Charles Bright, F.R.S.E., M.Inst.C.E., F.R.Ae.S., M.I.Mech.E., M.I.E.E., F.I.Rad.E., F.R.G.S., F.S.S., took the chair, and Commander F. G. Loring, R.N., of the Post Office, attended in order to make a special statement concerning the policy of the authorities with regard to amateur wireless. In his remarks this gentleman foreshadowed in broad outline the regulations of the Post Office in regard thereto, which are still in force. (*Vide pp. 461 and 462.*)

The history of the amateur wireless club movement in the United Kingdom during 1920 was remarkable not only from the numerical point of view, but on account of the high standard of skill and knowledge evinced by the members. Many hundreds of men received training in radio work during the war and now that that melancholy period is over large numbers of them undoubtedly stand amongst the first-rank amateurs. At the time of writing we have records of no less than 58 clubs, all in a healthy, "going" condition, and 24 of them are affiliated with the Wireless Society of London. One of the most satisfactory aspects of contemporary club work is that it shows signs of definite research. The conditions imposed upon private radio work, the stringency, or otherwise, of which it is not my province to discuss here, have forced amateurs thoroughly to examine all the fields of experiment which they may legitimately cover, and the result has been far from barren.

Needless to say, the study of the thermionic valve is the prime favourite, whilst experiments with "loop," ground, and tree aerials, and multilayer coils are exceedingly popular. The amateur construction of apparatus has reached a very high level, special ingenuity being shown in the design of compact, portable sets. Another good sign is the conspicuous lack of enthusiasm for aimless "listening in"; the press programmes, weather bulletins and time signals are carefully and keenly observed, and the tendency all round is to deal with wireless as a science and not as a mere electrical curiosity.

Some of the clubs have been formed in connection with Y.M.C.A. centres, technical colleges, and Boy Scout organisations, with the excellent result that their activities are largely devoted to the radio education of the junior members. This wise practice, however, is not the monopoly of the clubs I have indicated, a number of the others having adopted similar methods. Another result of the club movement, and one greatly to be encouraged, is the demand for lectures. Not for a moment would I recommend the "spoon-feeding" of students in order to save them the mental discipline of systematic private study. My point is that the demand for lectures has created lecturers, and many a person who has found himself "pitchforked" into promising to read a paper before his club has learned to stand on his feet before an audience and impart knowledge in plain English.

During 1920 the amateur wireless enthusiast had numerous opportunities of experimenting with the reception of radiotelephonic speech, most notable amongst which were those occasions when Marconi's Wireless Telegraph Co., Ltd., operated their fine plant at Chelmsford. Early in the year a long test of this station was carried out and the amateurs were specially asked to report upon the "signals" they intercepted. The desired co-operation was heartily accorded and the Marconi Company afterwards sent an interesting memento of the

occasion to all who had responded to their request. Since then there have taken place the memorable performances of Dame Nellie Melba. Mr. Melchior, the Danish tenor, and the interesting communications with Senatore Marconi's yacht *Elettra* and the S.S. *Victorian*.

Just at present the amateurs are looking forward with the keenest interest to a series of tests which are to be undertaken in February, 1921, by their fellow enthusiasts in the United States. Stated briefly, the American amateur believes he can bridge the Atlantic, using a power input of no more than one kilowatt, and he is going to try it out. Hence arises the need for sympathetic co-operation on this side of the water. British amateurs in this country have no chance of developing skill in the design of long distance transmitters, a circumstance which has led them to become especially clever in reception; so that the success of the great experiment is as much in their hands as in those of the initiators of the tests, for, parodying the old saying, one may say that it takes two to make readable signals.

It is a matter for great regret that owing to the disturbed conditions at present existing in Ireland the authorities have been compelled to place a ban upon private wireless work in that country. The amateurs are well represented there and not a few professional operators have been trained there. I have excellent authority for stating that in spite of the prohibition imposed on them in the matter of practical work, the Irish radio men are keeping up their enthusiasm by studying theory and hoping with us for the speedy return of peace.

Data concerning wireless clubs will be found in the following pages.

DIRECTORY OF WIRELESS SOCIETIES

THE following list has been brought as up to date as circumstances would allow. Wireless Societies, however, are constantly being formed, and it is possible that particulars may have been received too late for insertion. Every endeavour has been made to present a thoroughly reliable list, but no responsibility can, however, be accepted for any possible inaccuracies.

AUSTRALIA.

Wireless Institute of Australia (New South Wales Division)—Pres., E. T. Fisk ; Hon. Sec., Malcolm Perry, Box 2, King Street Post Office, Sidney, N.S.W. Tels., City 7349, Randwick 93.

Wireless Institute of Australia (South Australian Division)—Adelaide : Pres., Hambly Clark ; Hon. Sec., C. E. Ames. Age limit 16 years. Annual sub., 10s. 6d., payable half-yearly. Official Organ : *Sea, Land, and Air*.

Wireless Institute of Australia (Victorian Division)—Pres., Major W. J. Sheldon ; Hon. Sec., Capt. Roach-Pierson, Melbourne, Victoria.

Wireless Institute of Australia (West Australian Division)—Pres., W. R. Coxon ; Hon. Sec., G. W. Dean, 27, Holyrood Street, West Leederville, Perth.

BELGIUM.

Cercle Belge d'études Radiotélégraphiques—Sec., M. G. de Brandner, 76, rue du Lac, Ixelles, Brussels. Official Organ, *La T.S.F. Moderne*.

CANADA.

Montreal Radio Association—Sec., D. C. Greenhill, 4171, St. Catherine Street West, Montreal. Station and Club Rooms, Wilden Bldg., Bleury Street.

Radio Club of Winnipeg—Kelvin Technical High School. Hon. Pres., J. M. F. Wilson, B.Sc. ; Pres., J. R. Foster ; Sec. and Treas., E. A. Strong, Winnipeg. Number of Scholars : 40. Apparatus : 10 in. Induction Coil, $\frac{1}{4}$ kw. Transformer, Audion Receiving Set, Arc Generator.

Regina Amateur Radio Association—Hon. Sec., H. Miller, 2226, Searle Street, Regina, Sask.

Wireless Association of Ontario—Pres., Mr. Cameron Duncan ; Sec. and Treas., Mr. F. A. Clark, 18, McMillin Avenue, Toronto.

DENMARK.

Radiotelegrafist foreningen af 1917 (Skandinavisk) Copenhagen—Car Johansgade, 14—Sec. and Treas., R. Rasmussen. Formed September 8th, 1917.

FRANCE.

Association des Anciens Radios de 8e Génie—Hon. Pres., M. le Général Ierrié ; Sec., M. Alain Boursin, 2, rue de Vienne, Paris.

Radio Club des Ardennes—Monsieur M. Thirriot, 9, Rue Bahut, Mézieres (Ardennes).

Radio Club Belfortain—Pres., Monsieur Ch. Wandres, 31, rue de Mulhouse, Belfort.

Société de Radiotélégraphie et de Preparation Militaire—Pres., Monsieur Lavigne, 152, Avenue de Wagram, Paris (XVIIe).

Société Française d'Etude de Télégraphie et de Téléphonie sans Fil—Sec., Monsieur Roussel, 12, Rue Hoche, Juvisy (Seine et Oise).

Société Française Radio Sport—Pres., R. Bourgnignon, 152, Avenue de Wagram, Paris (XVIIe).

GREECE.

Union of Greek Wireless Telegraphists, Athens.

HOLLAND.

Nederlandsch Radio Genootschap—Utrecht, Sec., Willem Barentzstraat, 8.
Nederlandsche Vereeniging voor Radiotelegrafie—Rotterdam, Sec.,
Wijnhaven, 119.

Vereeniging van Radiotelegrafisten ter Koopvaardy—Sec., J. Schuitemaker,
Jerecholaar, 74, Rotterdam.

ICELAND.

Technical Society of Iceland—Sec., Otto B. Arnar, Reykjavik.

LUXEMBOURG.

Radio Club de Luxembourg—Pres., Dr. Eng. Rod. Wicking; Sec., M. J. Wolff, 67, Avenue Baumbusch, Luxembourg. Tel., Ville 1043. Official Organ, *T.S.F., Moderne*.

NEW ZEALAND.

New Zealand Amateur Wireless Association—Prof. Fari, Canterbury College, Christchurch, New Zealand.

New Zealand Amateur Wireless Club—Sec., F. Kellegher, 83, Marine Parade, Napier.

New Zealand Wireless Institute—Sec., J. O. Taylor. Minimum age 18. Annual sub.: Full members, one guinea; students and country members, 10s. 6d. Official Organ, *Sea, Land and Air*.

SOUTH AFRICA.

Radio Society of South Africa—Hon. Sec., G. L. R. Lowe, 51, Kitchener Avenue, Bezuidenhout Valley, Johannesburg.

UNITED KINGDOM.

Wireless Society of London—Pres., A. A. Campbell Swinton; F.R.S., Sec., L. McMichael, 32, Quex Road, West Hampstead, N.W.6. Tel., Hop 1564. Official organ, *The Wireless World*.

Aberdeen and District Amateur Wireless Society—Hon. Sec., W. W. Inder, 22, Gray Street, Aberdeen.

Altrincham and District Wireless and Scientific Society (affiliated to Wireless Society of London)—Pres., Major Hamilton, M.P.; Hon. Sec., W. N. Lambert, Breeze Crest, Plane Tree Road, Hale, Cheshire. Meetings every Thursday.

Barrow and District Wireless Association—Hon. Sec., A. R. Pennington, 73, Ramsden Road, Barrow-in-Furness. Holders of Receiving and Transmitting Licences.

Birmingham Amateur Wireless Association—Hon. Sec., J. B. Tucker, "Lynwood," Ashleigh Road, Solihull, Birmingham.

Birmingham Experimental Wireless Club—Hon. Sec., A. T. Headley, 255, Galton Road, Warley, Birmingham.

Birmingham Wireless Association—Hon. Sec., for W.T., A. H. Handford, Birmingham and Midland Institute, Paradise Street, Birmingham.

Bradford Wireless Society (affiliated to Wireless Society of London)—Hon. Sec., John Bever, 85, Emm Lane, Bradford.

Brighton Radio Club (affiliated to Wireless Society of London)—Hon. Sec., D. F. Underwood, 68, Southdown Avenue.

Bristol Wireless Association (affiliated to Wireless Society of London)—**Pres.**, Rev. A. P. Rigby; **Hon. Sec. and Treas.**, A. W. Fawcett, 11, Leigh Road, Clifton, Bristol.

Burton-on-Trent Wireless Club (affiliated to Wireless Society of London)—**Pres.**, Col. J. Gretton, M.P.; **Hon. Sec.**, R. Rose, 214, Belvedere Road, Burton-on-Trent. Sub. 5s. per annum.

Cardiff and South Wales Wireless Society (affiliated to Wireless Society of London)—**Hon. Sec.**, W. G. J. Howe, 25, Plasturton Gardens, Cardiff.

Crystal Palace and District Radio Society—**Hon. Sec.**, W. E. Harper, 25, Beckenham Road, Penge, S.E.20.

Chiswick, Acton and District Amateur Wireless Association—**Hon. Sec.**, C. Hirst, 58, Agnes Road, Acton, W.3. Meetings held at 126, Cranbrook Road, Chiswick, W.

Derby Wireless Club (affiliated to Wireless Society of London)—**Hon. Sec. and Treas.**, Capt. W. Bemrose, Littleover Hill, Derby. Annual sub., 5s.

East Kent Wireless Society (affiliated to Wireless Society of London)—**Pres.**, Major Martin; **Hon. Sec.**, H. A. S. Gothard, 8, Longford Terrace, Folkestone.

Edinburgh Wireless Club (affiliated to Wireless Society of London)—**Hon. Sec.**, W. Winkler, 9, Ettrick Road, Edinburgh.

Exeter and District Wireless Society—**Hon. Sec.**, H. E. Allcock, 11, Richmond Road, Exeter.

Glasgow and District Radio Club (affiliated to Wireless Society of London)—**Hon. Sec. and Treas.**, R. Carlisle, 40, Walton Street, Shawlands, Glasgow.

Glevum Radio and Scientific Society—**Hon. Sec.**, J. Mayall, Benfield Lodge, St. Paul's Road, Gloucester.

Gloucester Wireless and Scientific Society—**Hon. Sec.**, J. J. Pittmann, 1, Jersey Road, Gloucester.

Greenwich Wireless Society—**Hon. Sec.**, A. F. Borke, 27, Kidbrook Park Road, Blackheath, S.E.

Halifax Wireless Club (affiliated to Wireless Society of London)—**Hon. Sec.**, L. Pemberton, Y.M.C.A., Clare Hall, Halifax. Transmitting Licence up to 10 watts. 180 and 1,000 kw. Hours, 8—10 p.m.

Huddersfield Y.M.C.A. Wireless Society—**Sec.**, F. Simpson, 3, Daisy Street, St. Andrew's Road, Huddersfield.

Leicestershire Radio Society (affiliated to Wireless Society of London)—**Hon. Sec.**, W. E. Dunt, 45, Baden Road.

Liverpool Wireless Association (affiliated to Wireless Society of London)—**Sec.**, J. Coulton, 95, Ampthill Road, Liverpool.

Luton Wireless Society—**Hon. Sec.**, W. F. Neal, Hitchin Road Boys' School, Luton.

Manchester Wireless Society (affiliated to Wireless Society of London)—**Hon. Sec.**, Y. W. P. Evans, 7, Clitheroe Road, Longsight, Manchester. Headquarters, 335, Oxford Street, Manchester. Annual Sub., 10s. 6d. members, 5s. associate members.

Manchester Y.M.C.A. Wireless Club—**Sec.**, A. Day, 56, Peter Street, Man. Newcastle and District Amateur Wireless Association—**Hon. Sec.**, Colin Bain, 51, Grainger Street, Newcastle-on-Tyne.

North London Wireless Association—**Sec.**, J. W. S. Prior, c/o Supt., Peabody Buildings, Essex Road, N.1.

North Middlesex Wireless Club (affiliated to Wireless Society of London)—**Hon. Sec.**, E. M. Savage, "Nithsdale," Eversley Park Road, Winchmore Hill,

London, N.21. Sub., 5s. per annum full members; 3s., corresponding members. Tel.: Palmers Green 797.

North Staffordshire Railway Electrical Department Wireless Club—Sec., P. E. Banks, 87, Spencer Road, Shelton, Stoke-on-Trent.

Nottingham and District Wireless Society—Hon. Sec., J. H. Gill, 18, Fourth Avenue, Sherwood Rise, Nottingham.

Oxford Amateur Wireless Society (for Juniors)—Hon. Sec., S. Barter; Asst. Sec., P. R. Bunce, 7, Bartlemas Road, Oxford. Maximum age, 18.

Plymouth Wireless Society (affiliated to Wireless Society of London)—Pres., W. S. Templeton, M.A., B.Sc., A.M.I.E.E.; Hon. Sec., H. P. Mitchell, Municipal Technical School, Tavistock Road, Plymouth.

Portsmouth and District Wireless Association—Hon. Sec., R. G. H. Cole, 32, Bradford Road, Southsea.

Preston Scientific Society—Sec., W. J. Bryce, 119a, Fishgate.

Radio Scientific Society of Manchester (affiliated to Wireless Society of London)—Hon. Sec., P. Thomason, 7, Brazennose Street, Manchester.

Rugby and District Wireless Club—Hon. Sec., A. T. Cave, 3, Charlotte St.

Sheffield and District Wireless Society (affiliated to Wireless Society of London)—Pres., H. E. Yerbury, M.I.C.E., M.I.E.E., M.I.M.E.; Hon. Sec., L. H. Crowther, A.M.I.E.E., 156, Meadow Head, Norton Woodseats. Sub., 15s. per annum full members, 7s.6d. student members, and 5s. corresponding members. Meetings fortnightly, on Fridays at 7.30 p.m., held in Sheffield Municipal Officers' Club.

Southport Wireless Experimental Society (affiliated to Wireless Society of London)—Hon. Sec., H. Sutton, 62, Marshside Road, Southport.

Stockport Wireless Society (affiliated to Wireless Society of London)—Hon. Sec., Z. E. Faure, 3, Banks Lane, Stockport.

Stoke-on-Trent Wireless Club—Hon. Sec. and Treas., G. H. Adams, 23, Park Terrace, Tunstall, Stoke-on-Trent.

Sussex Wireless Research Society (affiliated to Wireless Society of London)—Hon. Sec., J. E. Sheldrick, B.Sc., Eng., 35, Southdown Avenue, Brighton.

Three Towns Wireless Club (affiliated to International Society of Radioists and Wireless Society of London)—Pres., Major the Hon. Waldorf Astor; Acting Sec., G. H. Lock, 9, Ryder Road, Stoke, Devonport. Sub., 5s. per annum.

Tynemouth Y.M.C.A. Amateur Wireless Society—Sec., L. L. Sims, Y.M.C.A., Redford Street, North Shields.

Walsall Amateur Radio Club—Hon. Sec., E. W. Bridgewater, 17, White St.

Walthamstow Amateur Radio Club—Sec., K. Hardie, 58, Ulverston Road, Upper Walthamstow.

Wellingborough Red Triangle Radio Society—Sec., H. W. Dunkley, Oxford Street, Wellingborough.

Wireless and Experimental Association (affiliated to Wireless Society of London)—Hon. Sec., G. Sutton, 18, Melford Road, East Dulwich, London, S.E. Meetings every Wednesday.

Wireless Club of Rotherwood and District—Hon. Sec., J. F. Trevor, Eureka Lodge, Rotherwood, Ashby-de-la-Zouch.

Wireless Society of East Anglia—Hon. Sec., Chas. Thayne, 29, St. Andrew's Street, Norwich.

Wireless Society of Epsom—Hon. Sec., E. J. Alway, 38, Miles Road, Epsom.

Wireless Society of Glasgow—Hon. Sec., W. Bucannon, 2, Drive Road, South Govan, Glasgow.

Wireless Society of Hull and District (affiliated to Wireless Society of London)—Hon. Sec., H. Nightscales, 16, Portobello Street, Holderness Road, Hull.

Wolverhampton Wireless Telegraph and Telephone Association—Hon. Sec., A. Lawton, Essington House, near Wolverhampton.

Woolwich Radio Society (affiliated to Wireless Society of London)—Pres., Col. Cousins, C.M.G., R.E.; Sec., W. T. James, 32, Lee Street, Plumstead, S.E.

UNITED STATES OF AMERICA.

Albany Wireless Club—H. S. Maguire, 814, Lancaster Street, Albany, N.Y.

Alpha Wireless Association—Valparaiso, Ind. Pres., M. E. Packman. Sec. and Treas., J. S. Webb, 757, Greenwich Street.

Amateur Wireless Telegraph Club of Calif.—Capitola, Calif., Box 55.

Amateur Radio Association of New Bedford—New Bedford, Mass., D. Tripp, 26, Ward Street.

Amateur Radio Research Club—St. Petersburg, Fla., Pres., Loren Davis; Sec., F. Klauman.

American Radio Relay League Inc.—Hartford, Conn. Sec., K. B. Warner, 721, Main Street.

Ark. Wireless Association—Little Rock, Ark. 216, W. 20th Street. G. O. Ranch.

Armour Radio Association, Chicago, Ill.—Pres., F. A. Goodnow; Sec. and Treas., R. Kenrick, 726, N. East Avenue, Oak Park, Ill. Call Letters, 9YL.

Astoria Amateur Wireless Association—Astoria, Oregon. Pres., E. P. Hawkins, 377, Commercial Street.

Austin Radio Club—Austin, Tex. Sec., C. R. Granberry, Box 663.

Bedford Wireless Association—Hon. Sec., J. Corconan, 470, Gates Avenue, Brooklyn.

Bellevue Radio Chain—Lincoln Avenue, Bellevue, Pa. C. Wray.

Birmingham Wireless Association—1428, North 12th Avenue, Birmingham, Ala. Sec., H. L. Ansley.

Bloomfield Radio Club—Bloomfield, N.J. Pres., F. J. McKinney, 300, Glenwood Avenue.

Boy Scouts Radio Club—Bloomfield, N.J. Pres., Munro de Forest; Radio Instructor, Fred. J. McKinney. Boy Scouts Headquarters, Trust Company Building, Bloomfield, N.J., U.S.A.

Brown University Radio Club—Providence, Rhode Is. Pres., E. Standish Palmer; Sec. and Treas., John J. Csepely, Wilson Hall, Brown University, Providence.

Burlington High School Experimental Station—Burlington, Iowa. Principal, Wm. H. Peters. Damped wavelength 400 to 4,000 M. Normal wavelength 500 M. Day range 750 miles. Power 1 kw.

Cape May County Radio Association—Wildwood, N.J. E. Schlichting, 224, E. Burk Avenue.

Carrollton Wireless Club—Carrollton, Ill. S. W. Pierson.

student to qualify for the Wireless Telegraph Service.

The Wireless Classes have been arranged for persons desirous of qualifying for the Postmaster-General's Certificate of Proficiency in Wireless Telegraphy as a necessary preliminary to their employment as Wireless Operators.

Complete courses in Wireless Telegraphy, including Morse Code, Magnetism and Electricity, principles of Wireless Telegraphy, use and adjustments of a full size Marconi apparatus, Regulations for wireless operators.

Students are prepared for the examination for the Postmaster-General's Certificate of competency as wireless operators.

The various systems of wireless, including the Telefunken, are explained, but principally the Marconi system.

The various systems of wireless, including the Telefunken, are explained, but principally the Marconi system.

CODE SECTION

(A) The Morse Code.

THE MORSE CODE

The Morse code used in all countries except America is known as "Continental Morse," to distinguish it from the original code invented by Samuel Morse and now used by America. All American wireless operators, however, must necessarily be proficient in the use of Continental Morse, and so the latter actually constitutes an international code.

Continental Morse is a dot and dash system, every letter or symbol consisting of a combination of these. Considering as an element either a dot or a dash, no ordinary unaccented letter is represented by more than four elements. Some punctuation signs, numerals and whole words are represented by more than four elements.

Rules for formation of Continental Morse code :

These rules apply irrespective of the speed of transmission.

- (1) The time occupied by a dash should be equal to that occupied by three dots.
- (2) The time occupied by the interval between two elements of one letter or other symbol should be equal to the time occupied by one dot.
- (3) The interval between two letters in a word should be equal to the time occupied by three dots.
- (4) The interval between two words should be equal to the time occupied by five dots.

Letters.

MEMORANDA

BURNHAM & Co.

**Manufacturers & Distributors
of Wireless Apparatus**

Deptford, London, S.E.8

*Amateurs, Experimenters and Educational Institutions
are especially catered for and all their enquiries,
however small, will receive prompt attention.*

The "BURNDEPT" Series of Coils for all Wavelengths
(Pat. applied for), Unmounted or on Plug Mountings.

A Large Stock Kept for Immediate Delivery of

COILS, SULLIVAN VARIABLE CONDENSERS, BROWN'S PHONES,
ACCUMULATORS, HIGH TENSION BATTERIES, DETECTOR
PANELS, GRID AND PLATE RESISTANCES, VALVE HOLDERS,
RHEOSTATS, POTENTIOMETERS, SMALL FIXED CONDENSERS,
INTERVALVE H.F. & L.F. TRANSFORMERS, EBONITE, BAKELITE,
KALANITE, Insulating Materials (tube, rod, sheet), SILK AND COTTON
VARNISHED TUBING, INSTRUMENT & RESISTANCE WIRE, Etc., Etc.

Agents for the

"M.O.V." Valves (as used by the Marconi Co., England)

R and R 4 B (4 pin caps). V 24 (4 contacts).

A large stock held for immediate despatch.

Agents for the DE FOREST CO., New York.

Radiophones, Buzzerphones, Honeycomb Coils, Receiving Sets.

Agents for

THE BRITISH THOMSON HOUSTON Co., Ltd.,
Rugby, England.

Receiving Set, complete with all accessories in one case, for
receiving time signals, telephony, C.W. and spark signals.

No aerial or earth connections necessary; stand anywhere;
switch-on valve and plate current; tune in and receive.

*For Particulars, Prices and Catalogue, send sixpence, and your
name will be registered for free distribution of subsequent leaflets
of latest apparatus which will be sent as issued.*

**Special Attention given to the requirements of Ship Operators.
American and Foreign Apparatus Procured to Order with a
minimum of delay.**

LOOSE

All types of books are adaptable to the Loose Leaf principle.

The following are a few in general use :—

**SOME USERS
— OF OUR —

HUNTLEY & PALMER, LTD.
ALLEN & HANBURY, LTD.
G.T. NORTHERN RAILWAY.
BARCLAY'S BANK.**

BOOKS

The "Lombard" Loose Leaf Book has, upon exhaustive trial, been found to be more durable and satisfactory than any other pattern of Loose Leaf Book. Many of the highly vaunted and loudly proclaimed makes are lacking the practical adaptability of the "Lombard"—its security, alignment of leaf, and its high standard of mechanical finish are believed to be superior to all others.

We can supply any type of book on the Loose Leaf principle—from a cheap temporary binder to a well-bound ledger.

We were amongst the pioneer manufacturers in this field, and are therefore better placed than competitors to deal with your enquiries.

An Outstanding Body at an astounding price

FOR YOUR FORD ONE TON CHASSIS

*The most remarkable Stand-
ardised Ford Van Body made!*

An exceptionally long body, allowing the greatest possible load space. Built strongly of seasoned hard wood to a simpler design, minimising weight and running cost. The extraordinary demand for this body enables us to deliver at a VERY LOW PRICE.

ABRIDGED SPECIFICATION OF T 6 TYPE BODY:

Length behind driver's seat	...	8 ft. (approx.)
Width	...	4 ft. 3½ ins. (approx.)
Height in centre	...	4 ft. 5 in.

Wind doors to open both sides.

Write for detailed specifications of the above body of our two models of extra long Lorry Bodies. Maximum utility space is allowed on both these Bodies.

PROMPT DELIVERIES

Let us fit a distinctive Coupé body to your Ford Chassis. A really smart and pleasing design, giving utmost comfort for two passengers inside with rear seat for two. Ugly front pillars obviated by use of metal. Head folds right down. Write to-day for full particulars. Makers of Standardised Bodies and FORD, DODGE and other small chassis.

This is a
body that

Interested in Wireless! Have You Seen These?

RECENTLY ISSUED:

ELECTRIC OSCILLATIONS AND ELECTRIC WAVES

By GEORGE W. PIERCE, PH.D., *Professor of Physics in Harvard University.* 515 pages, 6 x 9, illustrated. Price 30s. net.

A mathematical treatment of some of the fundamentals of the theory of electric oscillations and electric waves with application to radiotelegraphy and incidental application to telephony and optics. The selection of material particularly applicable to radiotelegraphy has been the first consideration; yet, because the electromagnetic theory, which is fundamental to radiotelegraphy is fundamental also to optics, wire telephony and power transmission, the book should be useful in these fields also.

Contents.—BOOK ONE.—Electric Oscillations. BOOK TWO.—Electric waves.

IN THE PRESS. An entirely new and up-to-date book on THE VACUUM TUBE.

ANGLO'S FUEL OIL

For Bunkers, Diesel Engines, etc.

Less Wear and Tear.

When using liquid fuel the furnace is subject to less wear and tear in every way than when using the cumbersome solid fuel. The contraction and expansion of the furnace during firing is reduced to a minimum, if not actually eliminated, owing to the constant and equal distribution of heat and the absence of any cooling effect such as is obtained when the fire doors are opened and a large volume of cold air passes into the furnace.

The Anglo-American Oil Co., Ltd., will be pleased to receive inquiries for all grades of Fuel Oil, supplies of which can be furnished from the Company's installations at the chief ports of the United Kingdom and Ireland; also the principal Colonial and Foreign ports throughout the world.

Inquiries should be addressed : Fuel Oil Dept.,
